3769. Message word wrap

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-01 00:10:30 UTC
From: cougercat
Topic: 3769 Message: 3769

Hmm - the first message was wrapped alright but every message after that has one word on a separate line. How can this be corrected?

From: jleahy00
Topic: 3771 Message: 3771

When I receiced my LCR (Little Chinese Radio) I was confused and felt alone and stupid..... I've been around radio since the late 50's and I have done a fair amount of programming too.

But then I found the UV-5R Group on May 5th. Things became clearer and I got to use my LCR and now am very fond of it.

BUT !! The best part is the entertainment that I've had reading the 1,925 e-mails since I found the group. I know that I've spent more than $50 on commercial entertainment and got less.

Thanks to all of you around the world that have brought this all together as it is also a great resource too.

73

John

The CHIRP Daily link was posted for you about 23 messages ago.

http://groups.yahoo.com/group/baofeng_uv5r/message/3759

I just tried it and it worked for me.

Also, the link is sort of hidden on the CHIRP downloads page. Here's a link to the message where I described how to find it.

http://groups.yahoo.com/group/baofeng_uv5r/message/3328

Good luck

3779. RE: [baofeng_uv5r] Minus offset display in channel mode

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-01 03:11:40 UTC
From: Tony
Topic: 3604 Message: 3779

I think this is normal because both my programmed memories show both the +
and - at the top when in channel mode.

Subject: [baofeng_uv5r] Minus offset display in channel mode

Hi,

I just manually programed an UHF repeater freq. with negative offset.

In frequency mode, the display shows only the minus "-" sign, as expected.

In channel mode, the display shows plus and minus "+-" sign, as unexpected.

I erased the channel and repeated 2-3 times the process and get the same
result.

I used the radio and worked fine in both channel as in frequency mode.

I'm not used software to program the radio.

Doe's any programed a negative freq. offset and get the same odd display
info?

Regards!

AJ

64-bit means the software is compiled to take full advantage of 64-bit hardware.

If software is compiled in 32-bit, it means there are some inherent limitations, like how much memory a program can address.

I have been monitoring this group every since I ordered my UV-5R about a week ago. Happy days - I got my HT today. Don't have a cable yet so I manually programed the frequency of our local repeater into the radio. I can hear the repeater ID when I go outside, but when I transmit my wife can't hear it on my base station. I assume I am too far away (about 5 miles) so tomorrow I will hop in the car and get closer.

The radio does TX and RX on simplex so that's a good sign.

I am really glad I found this group and will probably have some questions once my cable gets here.

Topic: 1718 Message: 3785

I use both to program my LCR (Little Chinese Radio). They both work and with some work do the same things as far as the results of programming is concerned. See previous messages of today that explain the benefits of CHIRP. The benefits only apply if you need them or have use for them. Just because something works better in one area over another..... if you don't need it, it don't matter. ie: buying A/C for a covertible never really made a lot of sense to me, but everybody does it today?

The objective is to program your LCR for your use and the use of this radio spans many, many fields. YOU need to decide if CHIRP is for you and does what you need. Take your time, download CHIRP and learn to use it and also use the BaoFeng software..... expand your knowldege and then decide on the Go-To package that fits your needs.

I would suggest that you check into the BaoFeng VIP software, early version as it allows some stuff that has been elimiated from other releases.

All in all I have to agree with a earlier poster that said that the Chinese just made these units for us to pick apart so that they could find out what was wrong with them !

I am impressed with the 5R ability with a Jpole (Slim Jim) as I use it RVing and consistenly can hit repeaters 15-40 miles away.

Finally I am using Windows 7 and have had no problems that I can assign to CHIRP or BaoFeng software..... Windows from day 1 (3.0) always seems to have issues, and that is the nature of the business.

I don't know if this has anything to do with the lockup problem or not, but I plug my cell into a USB port to charge it, and if I forget to unplug it, the next morning the computer will not boot up. I assume it sees the phone as the boot drive and tries to boot off of it. If I unplug the phone and reboot, then everything is fine.

I really doubt it has anything directly to do with CHIRP. More likely there is something marginally wrong with your system, perhaps some damage in the Windows registry. The CHIRP installation may have tripped it up as it opened and wrote to it.

You might want to run a registry cleaner utility (I use CCleaner most of the time). You may find it speeds up your system and increases stability.

The programming cable itself is seen by the computer unlike many devices that you plug in to your USB. The software sees this programming cable where say your camera software sees your camera not the cable..... if that makes any sense?

It sounds like you might be having a problem with your BIOS battery,
especially if your machine is over a few years old.

A common pitfall when programming the radio manually is that you have to program a given channel location twice--once for the receive frequency and then the same channel location again for the transmit frequency. That might be your trouble.
Here's a good YouTube overview: http://www.youtube.com/watch?v=56PvtAqacz8Ian

Thanks IronLight. I believe I got that part right. I found an example of manual programing and followed it. I set the RX freq using menu 27 and got a confirmation. Later I programmed the TX freq (.600 lower) and got another confirmation. I still have the original antenna, so I am thinking I am just out of range. If I still can't raise anyone tomorrow by driving into town, then I will have to look for a plan B.

On another note (or maybe not), I was listening to the repeater on my base station tonight and was getting traffic in Spanish from Puerto Rico. I got my license in Feb so haven't had much experience at this, but I never heard anyone from more than 30 miles away before.

A common pitfall when programming the radio manually is that you have to program a given channel location twice--once for the receive frequency and then the same channel location again for the transmit frequency. That might be your trouble.

Here's a good YouTube overview: http://www.youtube.com/watch?v=56PvtAqacz8

I have been monitoring this group every since I ordered my UV-5R about a week ago. Happy days - I got my HT today. Don't have a cable yet so I manually programed the frequency of our local repeater into the radio. I can hear the repeater ID when I go outside, but when I transmit my wife can't hear it on my base station. I assume I am too far away (about 5 miles) so

tomorrow I will hop in the car and get closer.

The radio does TX and RX on simplex so that's a good sign.

I am really glad I found this group and will probably have some questions once my cable gets here.

Ron -KK4HGY.

Hi Ron,

When you transmit (ptt) on the uv 5r, does it show the transmit offset freq of .600 Plus/minus the rx?

I see the setting you speak of in baofeng software, and like you, can't figure out how to program callsign. MAybe someone can help there

As for the chirp:

Download (Read) radio then select the "Settings" tab under "memories tab".
Then expand "+ All Settings", and select "Other settings"

Enter message/callsign.

DONT FORGET to select "MSG" under menu 38 (PONMSG) option on radio.

Werks for me :)

Our repeater freq is 145.270, which is what is displayed. When I PTT it
drops to 144.670.

ok cool.

Is there a PL tone needed to access the repeater?

On mine, i use a PL tone of 100.0Hz to access repeaters, and have selected from the radio under menu option 13, and a small "CT" shows up in upper left of radio display, when I PTT the 5R.

I don't know what else it could be?...

Yep, I programmed the tone and CT shows up when I TX. I don't know what
the range of these little HT's are, but I am 5 miles away from the repeater
and it's antenna is only 100 feet high, so I think I am out of range. I'll
learn more tomorrow. Thanks for all the input and help.

ok.

yeah... 100ft elevation @5 miles could be a problem. LOL

I'm hitting a repeater 15 miles away with this puppy on both Vhf, and Uhf...

But the repeater is on a mtn @ 10,670ft, and I'm at 5,200 ft above sea level :)

G'night.

It was recently added to CHIRP, so the latest daily build(s) should have it. I haven't upgraded recently myself.
If you're using the native Baofeng, there's a "VIP" version of the software in the "Files" section of this Group. It has an extra menu item "Other" that leads to a screen where you can edit the power on message. Look for
BF5R_VIP_CPS.rar

I have looked all over both the BaoFeng and CHIRP software and don't see any way of changing the power on message other than setting it to Full or Message. I would like to program my call sign in there.

We are at sea level or maybe a little below in places. Perhaps you saw on the news this week that our little town of Live Oak was flooded. Our power was out for 12 hours and we couldn't get into town for 3 days because the roads were flooded. There are still several roads that are impassable.

I can only dream of an antenna 10,000 feet high.

ok.

yeah... 100ft elevation @5 miles could be a problem. LOL

I'm hitting a repeater 15 miles away with this puppy on both Vhf, and Uhf...

But the repeater is on a mtn @ 10,670ft, and I'm at 5,200 ft above sea level
:)

G'night.

Yep, that's us. I think that 110ft above see level must include the 100
foot antenna. LOL.

I actually never bothered looking into that, so I took two UV-5R's, one with the oldest and one with the latest firmware.

The various settings don't make a difference here, it's either on or off. No differences to report between BRB231 and BRB251.

It seems that this is the third menu item which doesn't do what it's supposed to do. Squelch and VOX settings are the other ones. These too are either on or off, in spite of ten possible settings.

3818. Baofeng vs Wouxun

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-01 13:28:04 UTC
From: GaryErrol
Topic: 3818 Message: 3818

Don't get wrong, I'm enjoying my UV-5R and I plan on keeping it but I'm curious what some of you whom I'm sure have both think the plus and minus of the Baofeng UV-5R is vs. The Wouxun KG-UVD1P.

I know the Wouxum is about double the price. One feature I do like on the Wouxun is the channel selector knob on top of the radio. I'm used to Kenwood commercial radios and they have the knob. What other things do you like or dislike about both.

3820. Re: Baofeng vs Wouxun

Topic: 3818 Message: 3820

I have both- KG-UVD1P is two years old and still going strong. UV-5Rs are a few months old and work OK. I prefer the Wouxun, but maybe just because it has been with me for so long. Some have had frequency error problems with the UV-5R- mine just work. It is hard to beat the 5R- the price is right and the radio works.
My primary use is working on repeaters and programming HTs. Both Wouxun and 5R have the very handy Reverse function (short press *) for simulating a repeater- this is a necessity for my use.

For those running Linux, CHIRP is the only choice. And those with a penchant for knowing what's under the hood appreciate the DIY/maker/hacker aspect of CHIRP. Those that want a "just plug it in and make it work" may jot appreciate it as much. Personally, I find the CHIRP UI much more intuitive.

The only thing the uv5r has over the uvd1p is 2.5k step. Otherwise in
use and testing they are both the same..except. ..
programming the uv5r is a pain. The interfacing with USB Prolific chip
is unreiable.
I am building an interface cable not using Prolific but a Silicon Labs
CP2102 Chip
Cheers

I don't think it's a BIOS battery problem. The BIOS "boot order" is set to boot from USB first. My pc does this if I leave a thumb drive plugged in.

"It sounds like you might be having a problem with your BIOS battery, especially if your machine is over a few years old."

I like the ergonomics of the Baofeng better. It's not much smaller, but due to its shape, feels a lot smaller than the Wouxun. I also like its battery and belt clip arrangement better. It speaks slightly more than the Wouxun, and being able to directly enter a CTCSS tone is pretty handy, one less thing to remember. I also like that the Baofeng has a longer timeout before the menu exits.

However…

I like the Wouxun's VFO arrangement better. the B display is actually useful. You can program from either display. You can have two separate offsets stored, thus making programming of VHF and UHF repeaters easier, and the Wouxun saves your offset whereas the Baofeng does not. That's a big one, really, if Baofeng allowed one to store a VHF offset and a UHF offset separately along with being able to program from either display, I think it would win for "I like better" handily. As things stand, though? The Wouxun is still my go to radio, and the Baofeng just sorta hangs around the house with me mostly. BTW, similar to John, I've had my Wouxun for two years now, so that may play into it a bit.

Topic: 3827 Message: 3827

Greetings,
I now own the UV-5R. The radio is great, works well but tried to interface the radio with the computer. The cd that came with the radio didn't work. I tried several downloads and 3 computers. I got same results. Cannot connect with the transceiver. I am wondering if I got a bad cable. manual programming works fine. I am completely baffled by this. Any suggestions would be welcomed.

Thanks, Steven N1DRK

Topic: 3827 Message: 3828

You are not the first. There are a great many posts on the subject already that you can search through to narrow in on whatever problem you are experiencing.
I suggest you start in the "Files" section of this group, under "Programming Cable and Drivers" for many useful tips and notes.

What operating system? Win 7 has issues sometimes.
Things to try-
Use the correct two-pin cable and plug it in FIRMLY.
Download FindComPort.exe from www.wouxun.us and use it to verify your cable port number.
Make sure your programming software points to the cable port number.
Look in the 'Files' section for Driver and Win7 info. There is also a link to a VIP programming file.
Maybe try CHIRP- Download at http://chirp.danplanet.com/projects/chirp/wiki/Home
Then ask more questions if it does not work.

Your cable is likely not fully seated. Press it in HARD.

Many have found this to be the problem.

George

Ian has given some good advice here. If that isn't enough to get you going, come back and give us some additional information.

What OS are you using (Windows XP, Windows 7)?
What software are you using (Baofeng or CHIRP) and what version is it?
What kind of programming cable (USB or serial)?
If USB, what version of Prolific driver is installed (look in Device Manager)?
What COMM port number is being used (use FindComPort.exe from files area or look in Device Manager)?

And one last thing. Make sure the cable is fully plugged into the UV-5R. Some HT/cable combinations require a real firm push to make full connection.

Agreed...

Even when you think it's pushed in...it fails to interface w/radio.

An extra firm/hard push into radio fixes it everytime for me :)

I am in offset hell right now; I've got the 0.600 offset for VHF, but when I go to UHF, it still have the 0.600 offset. Is there a way to save a 5MHz offset for UHF only and .6 for VHF only; or is this one of the radio's shortcomings? I did not get my programming cable yet, so I can only use the keypad.

This is definitely a shortcoming, you'll have to set it when you want to use a different band. Either that, or just ignore the offset and program in transmit and receive by hand.

141.3 is the lowest tone that works with scanning. It is a firmware bug that they refuse or cannot correct. I am on my second radio and I have given up. If CTCSS receive is enabled below 141.3 Hz the radio does not stop on the channel. If you program the channel before with a tone 141.3 or higher and set the scan to TO it will stop on the first channel but not open sq. then time out and move to the next channel that is set below 141.3 and open sq. I do not understand why but that does make it kind of work. Even if you use tones above 141.3 the scan does not work well. It seems as if the programmer does not understand the concept of scan.
Sadly for me most repeaters around here use 131.8 Hz.

Just a shot in the dark thought about the nature of the bug,... it's only a guess, but I wonder if it is at some level simply a timing issue. A subaudible tine is a very low frequency, and the bug only seems to affect the lowest of those. Is it just a mater of the radio programming not hovering on the channel long enough to hear and accept the subaudible tone?

I don't think the offset issue is a monumental problem, particularly since I use the software nearly always. However, the question awakened my curiosity so I took a look at my 5R. Very interesting... I can put say .6 offset in the top display and 5 offset in the lower and they stay there. Unfortunately. the lower display does not program so the second offset can't be used. Maybe someone mucked up the firmware such that lower display doesn't work for programming when it should?? There is a lot going on in this little radio's firmware. Looks like they needed a good QC person with radio background. If you reset the radio, offset defaults to 1.6 so the programmer knew something about offset for 220 or whatever.
Maybe some clever person is going to find the path to programming from the lower display and open a whole new programming world.

The Baofeng software calls the upper diaplay the A Band Frequency Mode and the lower display the B Band Frequency Mode. I will refer to them as "A band" and "B band" for brevity.

When a Menu 40 RESET|ALL is initiated, the A band is set to VHF with SHIFT-D=OFF and OFFSET=00.600 MHz. The B band is set to UHF with SHIFT-D=OFF and OFFSET=01.600 MHz.

All of this can be configured with the Baofeng software. Either Band can be set to either VHF or UHF. SHIFT_D can be set to OFF, + or - (for each Band; A or B) and Offset can be set from 00.000MHz to 99,995MHz (for each Band; A or B). Many other options can also be set on a per A Band or B Band basis. Take a look at the Optional Features menu in the Baofeng software to see them all.

What this allows you to do, for example, is setup the A Band to UHF with SHIFT-D=+ and an OFFSET=05.000 and then setup the B Band to VHF with SHIFT-D=- and an OFFSET=00.600.

Then...

...if you need to quickly get on a 444.900 MHz repeater, you would switch to Frequency Mode, then switch to the A Band and then type in 444.900 and you are in business.

...if you need to quickly get on a 146.895 MHz repeater, you would switch to Frequency Mode, then switch to the B Band and then type in 146.895 and you are in business.

...if you need to quickly get on a 147.240 MHz repeater, you would switch to Frequency Mode, then switch to the B Band and then type in 147.240, then switch SHIFT-D=+ and you are in business.

Both the A Band and the B Band could be set to VHF with the A Band SHIFT-D=+ and the B Band SHIFT-D=-. That way you would access a + offset repeater from the A Band and a - offset repeater from the B Band.

Obviously, if there are CTCSS tones needed for the examples above, they would have to be configured as well.

Remember, the above is just to quickly operate the HT in Frequency Mode. It has nothing to do with programming the HT.

As we all know, when programming a channel from the keyboard, it has to be done while the A Band is selected. The RX Frequency and the TX Frequency are both entered when programming a channel. Because of this, SHIFT-D and OFFSET are irrelevant. I'll say it another way. It doesn't matter what SHIFT-D and OFFSET are set to when programming a channel. They aren't used for storing the channel.

Now here's a tip
Even though SHIFT-D and OFFSET aren't used for programming a channel, they are _useful_ for programming a channel. Say we want to program the repeater in the second example above. While in Frequency Mode and with the A Band selected, enter 146.895. Then setup SHIFT-D,

OFFSET, T-CTCS, TXP and anything else required for the channel. Then use Menu 27 to save the channel setup and the RX Frequency. Then tap the */SCAN button and the TX Frequency will be displayed. Now use Menu 27 again to save the TX Frequency. Done. No math to calculate the TX Frequency and no need to key it in.

HeyJim,

Thanks for the tip on the B band, which I've pretty much relegated to "mostly useless". Now, it's only "Fairly useless", but it at least has some use anyway. Shame one cn't copy the B band over to the A band for programming purposes though.

> Remember, the above is just to quickly operate the HT in Frequency Mode. It has nothing to do with programming the HT.
>
> As we all know, when programming a channel from the keyboard, it has to be done while the A Band is selected. The RX Frequency and the TX Frequency are both entered when programming a channel. Because of this, SHIFT-D and OFFSET are irrelevant. I'll say it another way. It doesn't matter what SHIFT-D and OFFSET are set to when programming a channel. They aren't used for storing the channel.
>
> Now here's a tip
> Even though SHIFT-D and OFFSET aren't used for programming a channel, they are _useful_ for programming a channel. Say we want to program the repeater in the second example above. While in Frequency Mode and with the A Band selected, enter 146.895. Then setup SHIFT-D, OFFSET, T-CTCS, TXP and anything else required for the channel. Then use Menu 27 to save the channel setup and the RX Frequency. Then tap the */SCAN button and the TX Frequency will be displayed. Now use Menu 27 again to save the TX Frequency. Done. No math to calculate the TX Frequency and no need to key it in.

Very interesting... I can put say .6 offset in the top display and 5 offset in the lower and they stay there. Unfortunately. the lower display does not program so the second offset can't be used. Maybe someone mucked up the firmware such that lower display doesn't work for programming when it should?? There is a lot going on in this little radio's firmware. Looks like they needed a good QC person with radio background. If you reset the radio, offset defaults to 1.6 so the programmer knew something about offset for 220 or whatever.

3845. Wouxun KG-UV2D

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-02 05:19:01 UTC
From: GaryErrol
Topic: 3845 Message: 3845

After thinking more about the UV-5R not having a rotary channel selector knob, I knew that was going to be a problem for me I found a used Wouxun KG-UV2D for $75 shipped, so I purchased it. I should have it later this week. As I think I understand, this is a slightly updated KG-UVD1P built for the USA market only.

I don't plan on getting rid of the UV-5R. For one, it will make an extra scanner. Maybe even a low power mobile. I live in a large city with several repeaters so a low power mobile won't be a concern.

I see that they make a dual slot charger for the KG-UVD1P. Can someone tell me if I can use it with the KG-UV2D. Since the both use the same battery, I'm sure I can charge two batteries but can I put the KG-UV2D radio with battery attached in the slot?

Now I just need to pass my ham license test on August 11th ;)

3846. Many Thanks

Hello all,
Many thanks for the suggestions but after 2 days of trying everything no success. It plain just won't work. I tried pushing the plug in very hard, didn't work. I tried sanding the plug a bit nothing. I guess the cable is no good. so it's manual programing i guess.

Thanks, Steven

I found that my USB cable fit the radio just fine but instead I had problems with the USB connection. I usually have to wiggle mine around or slightly pull out and push back in several times before it will read or write. Try that before saying your cable is bad. By the way this only happens with this cable. All others work fine.

Steven,
There have been several others that determined that their problem was a defective cable. One fellow even removed the outer plastic shell and made repairs.

Go ahead and order another cable. They're not that expensive. I got my working cables from www.409shop.com (part number 6-034 for $8.50) and www.dealextreme.com (search '66578' - $6.60). Both are shipped free. Expect it to take about 3 weeks to be delivered. You can also search eBay with '6-034' to get the cable from one of the 409Shop affiliated dealers.

Joe...you seem to be missing one setting. If the repeater output is 448.060, then you need a minus 5 MHz shift (transmit on 443.060) and the 100.0 is a Tone setting, not an offset.

You missed the little - sign in the repeater listing.

Common offset on 2 meter is 600 KHz, on 440 it is 5 MHz. In both cases, you have to look at the listings carefully... the split can be either up or down (usually down on 2 Mtrs and Up on 440, but subject to change for local conditions).

Hope this helps

As I said earlier, I couldn't hit the repeater 5 miles away on a 100 foot tower. I talked to another local ham who said that in fact the antenna had been taken town and was just sitting on the ground. I did drive into town today and was able to talk to someone via the repeater. I guess I was about 3 miles away and the antenna was on the ground. He said he could hear me just fine, so I am pretty happy about that.

Should have read your questions better. Program 448.060 with 100.0 tone and a 5 mhz. offset or 443.060 mhz. These radios are tricky at first.

Subject: [baofeng_uv5r] win system cant hear

hello all,
i have programmed the uv-5r to the win system repeater net.
example
448.060 100.0 offset
i can see the recieve light come on, full signal strength but cant hear it unless i hold moni.
i saw here somewhere i think, that i have to program encode and decode?
if so, how do i do it.
new ham with 2 new uv-5r radios
thanks

If you can't hear without pressing Mon, then the repeater is not sending tone and you have Rx tone selected. Turn Rx tone OFF and it will work. In my area, there are no Ham repeaters that transmit a tone so I just never enable Rx Tone.

thanks for all the input.
i got home and added the 5 mhz step,turned off the decode and set squelch to 3 and,
voila, it works :)
i also am running the chirp software on my mini laptop and the uv-5r program on the home
laptop.
i kinda like the baofeng version better, it has more parameters and since it is the first
one i used,
i got to like it better :/

--- On Mon, 7/2/12, Bob Javits <bobwb2@...> wrote:
Common offset on 2 meter is 600 KHz, on 440 it is 5 MHz. In both cases, you have to look at the listings carefully... the split can be either up or down (usually down on 2 Mtrs and Up on 440, but subject to change for local conditions).

2 meters: 600 Khz shift (.6 MHz) - below 147; + above 147; 147.000 can be + or -
440: 5 MHz shift 440 to 445 is +; 447 to 449 is -; 446 is simplex
220: 1.6 MHz shift (not really used here so I don't have it)

Around here, 440 interleaves the + and - by using 444.000+ and 449.025-, then 440.050+, then 449.075- and leaving distance between the pairs.

Then your offset must be set to 00.800. It should be set to 00.600.

Our repeater freq is 145.270, which is what is displayed. When I PTT it drops to 144.670.

Hi Ron,

When you transmit (ptt) on the uv 5r, does it show the transmit offset freq of .600 Plus the rx?

Tony: ?

145.270 - 144.670 = .600

Good to hear that Ron.

Sounds like the 5R is werking like a champ.

Should be good/interesting once they get that antenna back up at 100ft. :)

Jimmy

You must have missed my earlier post. I discovered that the repeater antenna had been taken off the tower and was laying against a building. When I got into town, and about 3 miles away from the repeater, I was able to contact another ham via the repeater. He said that he could hear me just fine. I could manually program the rest of the channels, there are not that many in this area, but I do have a cable on order. I especially like the idea of being able to program the name of the channels.

Yes, I am anxious for them to get the antenna back up in the air. There is some talk of putting it on a 300' water tower. Unfortunately, the water tower is several miles further away than the original tower is so it might be a wash. I am real pleased with my UV-5R though.

Good to hear that Ron.

Sounds like the 5R is werking like a champ.

Should be good/interesting once they get that antenna back up at 100ft. :)

Tony, check your math. 145.270 minus 144.670 is .600. That is the correct offset and direction for this portion of two meters. Easy mistake to make.

Whoops, looks like it is not a charger, it just allows your 5R to run off your car battery. Still not a bad idea. Saves on internal battery when you are in the car.

This site has everything from $49.00 5R's to red 5R's to cables to cases.

I've got the car adapter. I figure if needed, I can run it off any 12v battery if the power grid is down for any length of time.

I have to do some testing, I don't know if the cars electrical system will cause any TX/rx issues. I'll report back when I know, but it's going to wait until it cools off.

On the bigger battery, IMHO I'd rather just have a second regular battery. My stock seems to go forever as it is. I might try a heavy transmitting day on a fresh charge and see how long it lasts.

I purchased a second battery which for me seems to be better bet than a longer lasting unit. I also have the battery eliminator that I use in my motorhome (fulltime RVer). I am set up with a Slim Jim flexible Jpole and a breakdown PVC pipe mast which gives me a QRP station at the campsite on the road. I have not experienced any problems in the 2 months of use.

In Florida I get out over 40 miles to the '64 repeater. In the mountains of PA, NY & NH so far I'm around 15-20 miles. My last contact was about 20miles on 70cm.

I'm happy with the results.

3880. Split PL/DPL with Chirp Software

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-03 17:05:39 UTC
From: fdnybuff18
Topic: 3880 Message: 3880

Group,

Looking to do split PL/DPL using the Chirp Software.

Example: 114.8 pl RX / 155 dpl on TX. or Even a 023 dpl on RX / 114 on TX.

I can program in the recieve PL/DPL with no issue, just not the transmit PL/DPL.

I am using the build from 07/02/12

Thank you for any help....

Tone Mode: Cross
Cross Tone: DTCS->Tone (Transmit DTCS, Receive Tone)
DTCS Code: 155
Tone Sql: 114.8

It's confusing, I know. Almost every ham radio on the planet just supports Tone/Tone or DTCS/DTCS, and with the same tone/code. Since CHIRP was designed for that model, the method by which it supports the more complex operation is a little cumbersome.

This support is also fairly new and I don't hear much about it from users, so if you run into trouble, please file a bug and I'll try to address it.

Dan,

Thank you for response, worked like a charm. How about split DPL's? Ex: 155 dpl for tx / 732 for rx?

Thank you again...

That's not yet supported in the UV5R driver, but I've been working on it recently. When it is supported, you'll choose DTCS->DTCS as the Cross mode and there will be an "RX DTCS Code" column in addition to the other.

Stay tuned to the updates.

Jim... some repeater operators might wish to keep their Transmit PL tone a secret to keep out unwanted stations... either non-members or spammer/jammers.

So they can publish the Receive PL/DPL tone (the one the repeater sends out) so anyone can listen, but only those in the know get the Transmit tone (the one the repeater has to hear before it will receive).

It might also be a way to avoid interference from another repeater on the same frequency that uses the same tones, or it might be a way to select which repeater receiver hears the transmitter.

For example, in my area, one of the repeater groups owns two repeater locations on the same frequency pair in the same county. By using different transmit tones, a user can select which repeater hears him... with the same receive tone, all users hear both repeaters.

More than you wanted to know, I'm sure.

In my area, there are NO Ham repeaters that transmit Tone. All but two require Tx tone to activate the repeater. A number of commercial repeaters transmit tone and all require tone to activate. In setting up a radio, I suggest leaving Rx Tone (Decode) OFF to ensure that you can hear the repeater whether or not it sends tone. Only use tone to avoid undesirable noise or interference. Do not use tone on simplex- you want to hear any channel traffic prior to transmitting.

That IS tempting. Unfortunately, I just bought a spare 1800 mah and haven't even charged it yet. I've been monitoring local repeaters for days and my original battery hasn't dropped a bar yet. It's pretty impressive for $60 HT and a $12 battery. I'll probably just stick to the 1800 mah for now.

Good eBay store link. I may buy a mic. Thanks.

OK, My background is as follows. I am not a HAM, I no NOTHING about ham radios, I do not know any Tech Lingo, so please bear this in mind with replies. I am an EMT and purchased a UV-5R to program with the local ems, rescue and fire frequencies which I am getting off RadioReference.com The tones listed on the website are "271DPL" or "245DPl" or "127.3PL" I know when programming using the software or the keypad that anything listed as "PL" goes directly in under CTCSS, like "123.7PL" gets programmed in the software under the CTCSS menu as "123.7" My confusion is with the DPL tones. There are 2 options in radio. Radio Reference gives me "245DPL" the radio gives me the following options; "D245N" and "D245I" which do I use and how do I know this? I am taking all my frequencies and tones for programming off RadioReference and I am trying to program McMinn County, Polk County, Loudon County and Knox County EMS, Fire, and Rescue for southeast Tennessee.

Thanks

You will have to try each DCS code in N or I to find which works unless you can get info from communications provider.
If you program in the N code i.e. D245N and you can't hear the calls then try the D245I code.

You normally use the N codes. The I codes are exactly the same code but Inverted for use with radios that have inverted audio. The N codes usually work.

3896. UV-5R trivia question

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-04 22:18:58 UTC
From: dscolson1949
Topic: 3896 Message: 3896

When in channel mode and you start scanning, the channels usually start for the present channel and increment upwards.

Trivia Question:

How do you make it decrement the channels while scanning?

Well, if you setup your HT so it will only scan 2 channels, then I guess you could say it is scanning up and down as the same time!

If you are like me and have several channels that scan, you just start the scan and them press the down arrow. If you stop and restart the scan, the reverse direction will resume. It will continue to scan in the reverse direction until you press the up arrow or power off the HT (which resets it back to forward).

Correct! Discovered this quit by accident. While the radio was scanning, it stopped on a channel and I went to pressed a key to stop it scanning and I hit the down arrow. When it resumed scanning it was scanning in the opposite direction. I did not see this in the "documentation". Has anyone seen this documented anywhere? Now I have the more important question. What purpose does it sever to scan backwards? Or is this just a "feature"?

>
> OK, My background is as follows. I am not a HAM, I no NOTHING about ham radios, I do not know any Tech Lingo, so please bear this in mind with replies. I am an EMT and purchased a UV-5R to program with the local ems, rescue and fire frequencies which I am getting off RadioReference.com The tones listed on the website are "271DPL" or "245DPl" or "127.3PL" I know when programming using the software or the keypad that anything listed as "PL" goes directly in under CTCSS, like "123.7PL" gets programmed in the software under the CTCSS menu as "123.7" My confusion is with the DPL tones. There are 2 options in radio. Radio Reference gives me "245DPL" the radio gives me the following options; "D245N" and "D245I" which do I use and how do I know this? I am taking all my frequencies and tones for programming off RadioReference and I am trying to program McMinn County, Polk County, Loudon County and Knox County EMS, Fire, and Rescue for southeast Tennessee.

Found this by accident the other day. Perhaps its there if you're scanning a ton of channels, and don't have it set to stop on a channel but only pause, you can just hit down arrow to get back to it.

Just a guess. Weird you can sit and change directions back and forth while its scanning.

New on this forum so thought i'd give you all a heads up.
Spent ages trying to get Chirp and the official SW working on a windows 7 home premium 64 bit laptop with no joy, tried the drivers from here and W7 refuses to recognise them as being for my hardware, uninstalled everything and used the drivers from here, http://www.radioshop888.com/shop_displaynews.php?id=292&locate=1 USB Driver for Win 7_64bit and everything works fine, now i've just got to get used to what key and what menu function does what!

3914. Function question

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

Topic: 3914 Message: 3914

Can anybody tell me if this is possible and if so how.
Holidaying soon in North Norfolk, I normally bring along my Yaesu VR500 and a couple of PMR handies.
I know i can program all the listening frequencies in the UV-5R and use it as a scanner (marine, shop watch, security, pmr) what i want to know is can i do the following.
I intend to give a pmr to each of 2 kids, each on a separate transmit channel, can i scan all the listening frequencies (including the 2 pmr's as mentioned) and when one of the kids comes through answer them direct or would i have to manually set the UV-5R to which ever channel the kids where calling on?

If that is not possible, could i have both kids on the same PMR channel and scan and as above answer on one fixed channel or again would i have to manually select the correct channel to reply?

Thanks

Darren

I've installed the drivers on Windows 7 Home Premium 64-bit several times.
They work fine.

Mr Dazza,

The driver that I recommend for Windows 7 64- bit is "Win7Vista_64bit_ProlificUSB_v3200.exe". It is available in the "Programming cable and drivers" folder of this group's "Files" area. BTW, it is the same driver that you downloaded from RADIOShop888.

Darren,
As long as the SC-REV - Scan Resume Method (Menu 18) is set to "TO" or "CO" you should be able to make it work.

I can't say which is better though. They both have their down sides.

After scanning stops on an active channel, "TO" resumes scanning about 6 seconds later even if the channel is still busy. This is good because a lot of activity on one of your other monitored channels won't stall scanning. The bad thing is when you hear one of the kids, you will have to stop the scanning (press the PTT button or one of the keyboard keys) before the 6 seconds is up or the HT will resume scanning.

After scanning stops on an active channel, "CO" resumes scanning about 6 seconds after the channel is no longer busy. The good thing is when you hear one of the kids, you will have up to 6 second after they stop talking to stop the scanning (press the PTT button or one of the keyboard keys) before the HT will resume scanning. The bad thing is a lot of activity on one of your other monitored channels can stall scanning.

I choose "CO" for my day-to-day scanning. I'd probably switch to "TO" do you what you require. It is easy to change on-the-fly.

I don't know how many channels you will be scanning, but here is something else I would do. The UV-5R's scanning is kind of slow. I would program the 2 PMR channels that the kids are on spaced multiple times within your scanned channels. That will effectively 'speed up' the scanning of those frequencies and give the kids a better chance of being heard.

Many thanks Jim.
Im a long term scanner user, now sadly all i own is a yaesu vr500, i've also several sets of PMR/FRS/GMRS radios so i thought i'd try and combine the 2 so i bought a pair of Baofengs :)

Cheers Jim,

Scanned channels will be the UKPMR, a couple of business frequencies (shop watch/security) and the UK based marine channels.
So if i have understood the above correctly, the ptt button will tx on what ever the last active rx channel was as long as that is still displayed?
This dual display thing is kind of confusing me, i get it in frequency mode (top UHF, bottom VHF) but what about in channel mode?
After buggering about when i switch to channel mode i now get a frequency displayed on the top line and an alpha tag EG:PMR1 on the bottom line.

Topic: 3927 Message: 3927

I have been checking out the audio level of my new UV-5R using the Win System's internet streaming audio site. I get full locking on the repeater and no static but my audio seems very low compared to others. Have tried both the internal mike and the extenal one attached to the ear piece. Same problem. Is low audio typical with this this radio? Is there any way to adjust the audio?

Using the radio itself and testing FRS channels with a commercial Kenwood radio my wife says its quiet. Attaching the Kenwood mic to the Baofeng, I just make sure to talk loud and clear into the mic.
I suspect it might be designed that way on purpose. Since its not primarily a ham radio, a lot of commercial users might want a radio that doesn't pick up a lot of background noise in loud work environments.
I forgot where I saw it, but someone has a webpage showing several mods that involve bypassing certain components, which I'm not even going to attempt.
Seems the low audio is a quite common complaint online. I've learned to talk louder, clear and basically eat the mic.

I think I've heard someone drilling the hole bigger. Again, something I don't feel like doing.

What I find best is just talking louder than I usually do. Seems to be doing fine for me. And if you're too loud, the other end will just turn down their volume. I notice on my local repeater people come over in all volumes depending on their radio on their inbound signal.
YMMV

I purchased a low cost external mic from Powerwerx for the Wouxun radio. It is totally compaible and works great.

Something about the built in mic. It does not work on my UV-5R. In know othes have drilled the hole on the radio cover. I don't haver that capability.

Bear in mind. Pmr is not legal in the USA. you would be illegally transmitting in our 70 cm amateur band.

I wont be using pmr in the usa, thats why i've got pmr/frs/gmrs walkie talkies, hence getting Baofeng's so i have a 3 in 1 unit as well as being able to listen to marine etc.

Darren,

Yes, whatever channel is showing on the active display (A or B) is the channel you will transmit on (assuming the channel is not blocked from transmitting).

Yes, the dual display can be confusing. I should have mentioned that I would also suggest that you to turn off Dual Watch / Dual Reception (Menu 7 - TDR). I don't know that dual watch works very well and I'm not sure that it works at all when the HT is scanning.

Menu 21 (TDR-A) and Menu 22 (TDR-B) lets you select between Frequency, Channel # or Alpa Tag for each display when in Channel Mode.

The dual display can be useful, though. For example, let's say the kids are on channel 20 and channel 30. Set the upper display to channel 20 and the lower display to channel 30. Now you can quickly switch between kid1 and kid2 by pressing the A/B button.

Or say the kids are both on channel 40. Set the upper display to channel 40. Now do your scanning on the lower display. So with the lower display active and scanning, press the A/B button to stop scanning and jump the upper display ready to TX to the kids.

Wondering if this link might work on a 32 bit version of Windows ????? anybody know ?

If not does anyone have a link that might allow the 32 bit windows 7 to communicate with the Radio. I too use both chirp & Baofeng software.

Also check that you are using the correct deviation. If you are on HAM bands, it should be Wide. (FRS uses Narrow.) If you have Narrow deviation set on a Ham band, then you will sound low because you signal is not deviating enough to get the volume.

My Kenwood commercial radios have the battery save option. I always turn it off. I read some place some years back that having battery save enabled can cause you to possibly miss the very beginning of some conversations. I always purchase the highest capacity battery I can find. If I'm going to using my radio for an extended period, I'll take an extra battery or two with me.

Dragos,
It is the Battery Save function. It set the ratio of 'ON time' to 'OFF time' of something. I don't know that anyone has ever figure out what.

If you would like to know more about the 41 menus, check the 'Manual Programming Menu' page at...

http://www.miklor.com/uv5r/

or these files...

BAOFENG UV-5R Menu.xlsx
baofeng-uv5r-eyes-free.rtf

in the Files area of this group.

Darren,
Channels are stored in a single 'bank', if you will, of 128 channels (0-127). There is no A or B involved (other than you have to have the A display active to program channels via the HT keypad and I find this a good practice for software programming as well).

The A display (upper) and the B display (lower) both have access to the same 'bank' of 128 channels.

The bad thing is a lot of activity on one of your other monitored channels can stall scanning.

> > > > I choose "CO" for my day-to-day scanning. I'd probably switch to "TO" do you what you require. It is easy to change on-the-fly.
> > > >
> > > > I don't know how many channels you will be scanning, but here is something else I would do. The UV-5R's scanning is kind of slow. I would program the 2 PMR channels that the kids are on spaced multiple times within your scanned channels. That will effectively 'speed up' the scanning of those frequencies and give the kids a better chance of being heard.

Tadej,

CHIRP allows you to program frequencies up to 512MHz. This is certainly outside the range stated by Baofeng so it is possible to 'hack' some extra frequency.

Take a look at this file in the Files area. UV-5R File Modification.pdf

This file explains how to 'hack' a .dat file to enter unusual frequencies into a UV-5R. I've never do this myself. You are on your own and responsible to any bad (or good) that comes to your HT if you follow this guide.

not the steps for tx rx.the steps for radio mode.in radio mode are only 100khz from 65-116mhz range.

Not to add to the confusion but.... I use the dual watch (TDR) quite a lot. The radio scans between the 2 channels displayed (A/B) and at least on my unit stops AND remains on the last channel received. There is an indicator that shows the channel. I guess that I would label theeach channel with a child's name and then you would know which one called. Otherwise your radio will transmit on the last channel that it received.

If it was me I would have the other units on the same channel so I would not have to repeat myself to each child........

With TDR ON (Menu7) and Menu 34 OFF, the radio follows the last active channel and Tx is on that channel. Menu 34 A or B forces the radio to Return to A or B following any reception. Did I make that confusing enough?

This is a feature that has been used on handie talkies for decades as a method for extending time between battery charges. How it works is to cycle the power to most of the unit on and off. Typically the cycle time is less than a second. If the squelch opens, the radio stays powered up otherwise it powers down again. The save values usually mean on and off duty cycle. 1/1 would mean on for one period and off for one. 1/2 would mean on for one period and off for two periods. You can probably work out the sequences for 1/3 and 1/4. What we do not know is what each period is but the stock 1/3 rarely miss much of a transmission. In general, leaving it at 1/3 works OK for most of us since the unit does not go back into save mode for several seconds after the last receive or transmit (the same period as the delay for scan resume). 1/3 probably doubles how long a charge on the battery lasts in typical use.

Hi Everyone,

I'm wanting to get a speaker mic for my UV-5R. Is there a specific make or model that works best with this radio? I really want a PTT button that can't be easily tapped or bumped causing the radio to transmit. Is there a Motorola or other name brand speaker mic that will work with this radio? I hope this makes sense....

I think I know the answer to this so am mostly hoping someone will tell me I am wrong and save me some time.

Since the BaoFeng software can't remember anything does that mean if I want changes made to the Optional Features menu item I have to remember to open that menu and make the changes all over again each time I restart the software?

Sure you can save your settings in the software. Go to Files (top left of top bar) the save to your computer (you choose the file name).

Mike,

So far I have purchased 2 different speaker mics for my UV-5R.

The first is a part number 41-24K that I bought from 409shop.com and it currently sells for $10.50 shipped. You can also search eBay with the same part number number and several 409shop affiliated dealers have it for $9.80 shipped.

The second is a Kenwood KMC-17 speaker mic that I bought from dealextreme.com for $12.70 shipped. Search for 106859.

Both are shipped from Hong Kong and took nearly 3 weeks to be delivered to my address in the USA.

As you requested, you are wrong.

The only thing that I know of that the Baofeng software doesn't remember is the COMM port setting. So unless you are using COM1, the correct COMM port has to be selected every time you launch the software.

I often do a Menu 40 RESET|ALL to do experiments and the like with full confidence that all of my channels _and_ settings will be restored once I upload them to the HT.

#1 - FRS is defined to be narrow-band. DO NOT program it for wide-band transmit or you will trash adjacent GMRS.

#2 - because the power can be increased and it has a removable antenna and they are not type accepted for FRS, it's illegal to use these radios on FRS - your Kenwood commercial rig, probably wide-band and not a Part 15 accepted radio, included.

Part 90 does not mean you can (legally) transmit with the radio wherever it can be programmed, and the FCC has cited shops for programming transmit on frequencies you have no license to operate. I know, it's not in the ham-cram and most radio manuals...

#3 - non-GMRS/non-T-band commercial use in 450-470 is also mandated to go narrow-band

so has anyone found something on this theme.i looked at uv-5r sheme and details of rda chip on their official page but i cant figure it out how the catch is only in firmware.i mean the chip supports vhf 134 to 174 and uhf 400 to 500. but the wierd thing is you cant set it lower than 136 in uv5r but you can set it with chirp up to 511.990.

and there is also a question of am modulation...

im also fresh in this probably saying rubbish but...the debate must go on if it leads somewhere...

You can add a small speaker and a cord to existing hearing protection muffs and get really good radio audio. I maintain a bunch of Peltor Headsets that fail often so I found a reliable replacement speaker that can be used in any protective headset.
JohnW
W5JHW

> At work we wear hearing protection. With the HT clipped on the belt or pant pocket, even with the volume full up, it is impossible to hear what is said on the HT. A speaker mic in this situation is practically a must.

Remember that the Programming Software does not 'remember' settings. You must 'SAVE' the data to a file.

Hi Mike,

Ive used a kenwood th-f6a speaker mic, an ear vibration mic and an ear acoustic tube mic with the radio and all work fine. i like the ear tube the best. it cuts out a lot of the noise, as i do parades with my daughter and i blend in with security... hihi. the kenwood mic works very well, nice construction and has volume control on the mic itself. the ear tube and vibration mics have ptts that can be placed almost any spot on the body, so bumping the ptt can be avoided. hope this helps.

Hi Everyone,

I'm wanting to get a speaker mic for my UV-5R. Is there a specific make or model that works best with this radio? I really want a PTT button that can't be easily tapped or bumped causing the radio to transmit. Is there a Motorola or other name brand speaker mic that will work with this radio? I hope this makes sense....

in my situation Dennis, an in ear provides almost 100% noise reduction. with 30 plus fire engines all going off at once, even the radio up to the ear can be very hard, plus privacy. Crowds dont need to hear whats beeing relayed to net control about the kids. so it all depends on the need of the user.

With a radio this small, why would you need a speaker mic? I just use the radio as I would a speaker mic. The antenna is at optimum height
and clear of body absorbtion of signal, especially for UHF use. A waste of money IMHO.

I have been lurking for quite some time as I have been very interested in getting one of these little rigs. I did hold off getting one due to the "off frequency" issue that the early releases have. I looking back at some older postings, I get a mixed view on whether or not the issue has been resolved or not.

So, the big question is - has it been resolved and if so, what FW version should I be looking for?

I have one of the earlier units and have had zero issues (as far as I know) with freq issues. On 2m I hit repeaters 35 miles away in Florida and we currently are in the woods/mountains in NH and hit 70cm about 15 miles distant so I do not believe that off freq is an issue for me.

I should mention that I use a Flex J-Pole antenna on top of a 10' PVC mast.

There may be a problem here or there but overall this is one heck of a unit for $50 !!

John I realize that there are situations where a speaker mic or a spy type earpiece can have advantages. But a speaker mic on the Baofeng UV5r would have no cost effective use. The crappy freebie earpiece that comes with the UV5r would be perfect for in ear under earcup use. The speaker mic being almost as big as the radio itself seems to be overkill. An acquaintance of mine some years ago adapted a speaker mic from a Motorola HT220 to work with his Yaesu VX-2r (HI HI) and the speaker mic was heaver and just as large as the radio. Now if you came across a cherry condition public service unit with the antenna mount that would be advantageous. Looking at the radiation pattern of an HT belt carried, most of the transmitted signal is absorbed by the body. As is quite a bit of the received signal. With VHF and UHF antenna height is critical. I realize that intercrainal and interocular heating can be significant at hi power, so can kidney and testicle radiation absorption. Everything is a compromise. But dependable communication is the required result.

By the way, what super station do you work in that runs 30 engines at one time? You must have some huge fires.

If you have a HF transceiver (or know another Ham operator that does) that has all mode capabilities, listen to an AM signal in FM mode. That will let you know why they are not compatible. Now FM can be understood on a AM receiver due to slope detection. Not always a pleasant quality but doable. If you want to listen to aircraft and Ham and Public service why not just buy a cheap scanner. As for transmitting on aircraft frequencies I don't believe you would want the FCC AND FAA coming to see you with Federal Warrants in hand. It would be a VERY UNPLEASANT and expensive visit.

so has anyone found something on this theme.i looked at uv-5r sheme and details of rda chip on their official page but i cant figure it out how the catch is only in firmware.i mean the chip supports vhf 134 to 174 and uhf 400 to 500. but the wierd thing is you cant set it lower than 136 in uv5r but you can set it with chirp up to 511.990.

and there is also a question of am modulation...

im also fresh in this probably saying rubbish but...the debate must go on if it leads somewhere...

This morning I posted a "UV-5R Mini FAQ" which (I think) describes it in more detail. These Q's were asked over and over again, some by e-mail.

Q) How does the `Save' system work? What do these numbers mean?

A) The numbers (1-4) represents the number of cycles the HT goes into sleep mode. Five cycles appear to be equal to 0.5 seconds. The higher the number, the more battery energy is saved. When in save mode your UV-5R will become somewhat sluggish though, and you might miss a word of two when your monitor frequency becomes active.

And:

Q) Keys don't seem to respond immediately, sometimes I have to press them twice before the UV-5R reacts.

A) Check menu 3 (Save Mode). When set to `Off', all keys will respond immediately. Any other value will put the UV-5R into sleep mode for a certain amount of time. Pressing a key for the first time will only wake up the HT, but will not perform the desired function.

I like the speaker mic for my car. Dragging around my radio with my sma to bnc adapter hooked to my external antenna is going to screw up the antenna location on my radio. I'd rather use the mic.

Plus, I get better audio.

I'm not sure that saying a radio doesn't need a speaker mic because of its small size. Nor because of kidney or other internal organs. Most users of this radio don't carry it daily. So such damage isn't going to be much of a concern. Also a speaker mic will allow you to keep the radio under clothing during bad weather.

A few years ago I worked a large event. I had an event radio with speaker mic on one side. On the other side I had my Kenwood TK-3160 with Li-on battery attached to my shoulder epaulet. Still I like speaker mics when in range of who you want to contact or working with a repeater in range. I really don't care which is larger, if it works an one likes the setup, what concern should it be to you, or others?

Oh, look on eBay, the do make a speaker mic with antenna connection with thee the 2-pin Kenwood connection and SMA connection for something around $20. Ships out of China, I believe. Some like it, some don't. I have one but seldom have used as I normally use a Kenwood TK-390 with KMC-26 antenna speaker mic.

Wow, what a interesting conversation that has been started. I'll let you all argue about whether or not there is a need for a speaker mic with a compact ht and whether radiation is better absorbed by the body or the head...not sure where I stand on the issue or whether I'll spend any time thinking about it.

I'm building the HT system that I think will best meet my needs. I have the UV-5R, I've ordered a 17 inch replacement dual band antenna (currently on its way from Hong Kong). Next I want to get a speaker mic and then I'm going to get the new 3600 battery and my system will be complete unless I decide to get an adapter for a mobile 5/8 antenna in my car.

I've narrowed my choices down to the following:

http://www.ebay.com/itm/330760003647?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649

http://www.ebay.com/itm/120914774114?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649

http://www.ebay.com/itm/180808619114?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649

Tell me what you think....

Thank you for your detailed answer !
Still, even in Save mode 4, my HT seems to promptly respond !

I would go with the kenwood branded mic. Ive had several of the cheapies and they didnt hold up for me for light duty use.

Denny i work parades as my daughter does pom pom competition, and most of them are fireman's parades. we always seem to get stuck behind all the trucks and when they all fire up and blast their horns i cringe. can hardly hear another station up the block. i get the joy of walking the routes, and relaying info to stations up ahead of me. we provide support for heat stress and other problems, either handing off the child to ems or stuffing them in an air conditioned support vehicle. this past weekend was the most stress related, 15 out of 20 girls suffered some sort of a heat issue. what fun!!!

Wow, what a interesting conversation that has been started. I'll let you all argue about whether or not there is a need for a speaker mic with a compact ht and whether radiation is better absorbed by the body or the head...not sure where I stand on the issue or whether I'll spend any time thinking about it.

I'm building the HT system that I think will best meet my needs. I have the UV-5R, I've ordered a 17 inch replacement dual band antenna (currently on its way from Hong Kong). Next I want to get a speaker mic and then I'm going to get the new 3600 battery and my system will be complete unless I decide to get an adapter for a mobile 5/8 antenna in my car.

I've narrowed my choices down to the following:

http://www.ebay.com/itm/330760003647?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649

http://www.ebay.com/itm/120914774114?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649

http://www.ebay.com/itm/180808619114?ssPageName=STRK:MEWAX:IT&_trksid=p3984.m1423.l2649

Tell me what you think....

The third spkr/mic listed is a Motorola type- 8mm is too narrow pin spacing for the UV-5R.

The "Save" menu DOES work, every once in a while when I hear our repeater come up and ID
It will miss the first syllable or half a word at the start but most times it comes right up
And nothing is missed.

You're second link. The Kenwood, looks like the one I use. Mine was gifted to me, and has no markings to indicate model number. But it's a spitting image.

Mine works like a dream. No TX issues, rx audio sounds a little better than the Baofeng itself. The more I look into the kmc21, I'm pretty sure that's what I'm using.

I can't recommended it enough, it's a great mic.

Oh, using the Baofeng with this mic and my 5/8 wave nmo mounted antenna is a great mobile combination.

Cursory test- With Save OFF, 102ma with Backlight and 68.5ma quiet standby. Using a digital meter so measurements with Save 1 and Save 4 were not precise. Both Save settings appeared to cycle at about the same rate, so I suspect there may not be much difference between settings.

Been there, done that
I assumed that would save the settings but it isn't, at least on this end
I open the Optional Features and tweak time out timer and scan resume, close the Optional Features window and save the file
Shut down and reopen the software and tell it again that I speak English
I read in the file I just saved and open the Optional Features page and the settings I thought I just saved are back to the defaults

BUT . . .

Just to be sure, while I had the Optional Features window open I saved the file, shut down and restarted
This time the changes were saved
So it looks to me that you have to perform a save from each window where you have made changes in order for those changes to be saved

It would be really hard to tell when the receiver is switching in and out at a .1 to .4 second interval.
I may give it a try here and see what I can see. Will let ya'll know if I come up with anything positive.

Subject: [baofeng_uv5r] Re: save menu

Cursory test- With Save OFF, 102ma with Backlight and 68.5ma quiet standby. Using a digital meter so measurements with Save 1 and Save 4 were not precise. Both Save settings appeared to cycle at about the same rate, so I suspect there may not be much difference between settings.

Mike,

The first on looks like the Kenwood KMC-17 I bought from DealExpress.com. Roughly the same price. When we bought our Kenwood HTs for work I believe my choices were the KMC-21 and the KMC-17. I believe my research showed that the 17 was supposed to be more rugged than the 21 so that is what I went with at work. For that reason, I'd probably choose it again here.

If I lived closer to the repeater this would be great. Unfortunately I need the extended reach of the 17 inch antenna I've ordered. Thanks for the info....

Charlie,

Since you have to select English, I assume you are using the VIP version. I'm using the V12.03.06 (non VIP) version.

I can change an "Optional Feature" or "DTMF" setting, click the [Close] button and then save the settings to a file. After that I close BF5R, launch BF5R and load the file that was just saved. All changed settings were restored a saved.

Believe me, I learned a lot today and made changes in both menus.

Thanks Tony. I had just set mine to OFF a couple of days ago based on discussion in the group. I may go ahead and change it back to 3 or 4. I scan most of the time anyway, so it isn't unusual to miss chunks of sentences. So a syllable here and there won't hurt me any.

There seems to be a lack of consistency in how the pin spacing is measured and advertised. I saw one eBay ad that went to the extraordinary length of showing two diagrams, one with spacing between the closest exterior walls of the pins as 8mm, and one showing the spacing between the center lines of each pin, at 11mm. All measurements give or take.
The third original link states Kenwood not Motorola. I think it's all right. In any case, here is an alternate. I bought one and quite like it. It looks identical to the 3rd link one but is stamped "Kenwood". (Believe that or not as you may.) Same "Chinese price" range.

The third spkr/mic listed is a Motorola type- 8mm is too narrow pin spacing for the UV-5R.

Air-band is AM, therefore the FM receiver wont receive the traffic (been there, done that, shoulda know better)

Anyone know where i could order some red outer shells like wouxon.us sells for the UV-3R? I don't feel like buying another radio just to get it in red.

I had looked at a couple of the pin diagrams as well and wondered if only certain ones would work because of the distance between the 2 pins. I'm gonna think on it some more this weekend and probably order one on monday...I'll let you know which one I get.

Well, it seems that the ANI-ID code is send in alarm mode if AL-MOD is set to CODE.

If PTT-ID is enabled, the HT seems to send the S-CODE set for that channel, not the ANI-ID.

What is the repeater tail-tone ? Why it should be cut ?

I'm using the Wouxun mic. on my UV-5R. I picked up another one last week for my other radio. They are pretty sturdy. I purchased both of mine from Powerwerx, but I've seen them cheaper elsewhere.

The internal mic on the UV-5R is totally useless. If you use the internal mic your tx audio will be so low no one will understand a word you are saying. You MUST use the mic/speaker combo that comes with the rig.

I did some experimenting on simplex with a close receiver - it is a pretty quiet mic, but will work best if you are sure to speak into the very bottom of the speaker/mic and even angle the radio a bit.

Having said that I agree that it is very insensitive and works way better with the earpiece/mic.

Also I found it works really well with a Wouxon speakermic - very loud and crisp!!

Go to the "Files" section of this group, and look in the folder "Programming Cable and Drivers". Take a look at the .PDF document there which describes what you have to do to make Windows 7 behave. The driver you need is there too.

It's my understanding that I need to load a special driver on a Windows 7 service pack 1 (64bit) computer before you can use the Singapore USB cable to program? Can someone direct me to the location? Thanks,

73

John

I disagree. This morning I let my wife use my UV-5R while I took a short drive with my Wouxun KG-UV2D. The received audio from the Baofeng to my Wouxun was clear. Both of were using the radio's internal mic's.

The internal mic on the UV-5R is totally useless. If you use the internal mic your tx audio will be so low no one will understand a word you are saying. You MUST use the mic/speaker combo that comes with the rig.

I have been reading this group for a couple of weeks now and many have reported that their 5R works great in both TX and RX. I have not used my 5R much yet, but so far I am very happy with it. There have been some reports of low volume when you transmit. Once solution is to drill the mike hole out. Obviously you have to be very careful when doing this.

Read the guide in the "Programming cable and drivers" folder of the files area and then get the drivers from the same area.

I agree with your agree to disagree, or did I get that backwards? And I support your right to disagree.

Seriously, I suspect there is some unit-to-unit variation in the transmit audio, so your experience may be different that other people's experience.

I was completely convinced my unit had low TX audio and connected it up to my test equipment to prove it.
What I found was that the mic audio is OK, it just depends a lot on the positioning of mouth vs HT.

Me too. The original comment was a bit polarized imho.
It may depend on firmware version. Many have had low audio; many have had no problems. I safely drilled the hole to 1/16" when I had the unit apart for another reason. At that, I am told my audio is fine if i speak directly into the orifice. So a plug-in of some description is desirable, but the internal is not "totally useless".
Just a manner of expressing oneself I expect.Ian

I am considering the purchase of the UV5R for use with a cross band repeater. I would transmit on VHF and receive on UHF. Can this radio operate this way?

Bob, my uv5r, which I have been using for about 3 months works fine with the internal mic. In fact, I am told that others can't tell if I am using a speaker mic or the internal mic. (Just my 2 cents worth.)

The internal mic on the UV-5R is totally useless. If you use the internal
mic your tx audio will be so low no one will understand a word you are
saying. You MUST use the mic/speaker combo that comes with the rig.

Eric,
I've not done this myself but there have been several messages in the group reporting that is works. Just search the group using "satellite" as the search term and you will see several messages.

Also, my understanding is that the cross band programming has to be done with software. So don't forget to purchase a programming cable.

And while you are waiting for them to arrive, read the guide in the "Programming cable and drivers" folder of the Files area.

1. Get a programming cable. You will need it because you must program all the channels so that transmitting is inhibited.

2. Make sure you have done step 1

3. Determine what frequencies you will be scanning.

4. Using the programming cable (see step 1) and Baofeng programming software, enter the receive frequency for each channel into the RX Frequency column and then immediately delete the frequency that automatically get entered into the TX Frequency column. It is very important to keep the TX Frequency column empty.

These radios are built for commercial use and designed for use in noisy conditions. The mic sensitivity is low for this reason. You must talk very close to the mic itself and quite loud. This way you will get very good transmit audio. Your mouth needs to be almost in contact with the radio. If you try to talk any other way your audio will be very low.
A common complaint with some Japanese handhelds is that there is a lot of background noise due to the high sensitivity of the mic, especially with Icom radios around here.
I prefer the low sensitivity of the UV5R and get good audio reports with a quiet background.

If you know the frequencies that your local fire departments use, you can store those frequencies into channels (first in VFO and then in memories) and then scan.

If you do not know the frequencies, check with a friend, a nearby Radio Shack store, possibly Radio Reference, to get those frequencies.

Do not enter an offset (offset = 0000) and do not enter the transmit frequency.

You don't *HAVE* to use the cable. It's just good form to make sure that
you can't transmit on those frequencies to keep yourself out of trouble.

I'm pretty sure you could achieve the same effect manually, but I've never
tried it.

Or you could just be really, really careful, but I think it's best to make
an effort not to screw up.

Regardless, another advantage of using the programming cable is that you'll
be able to enter an channel label. As far as I know there is no way to do
that manually with this radio.

> to listen to but not talk on?

It should work on any frequency that the radio is capable of receiving:
136 to 174 MHz and 400 to 480 MHz.

Generally includes fire, police, troopers/state police/highway patrol,
cabs, water company, railroad, city public works, etc.

I am not a lawyer, but it might be good to check local ordinances to be
sure that listening is not illegal in your area, but that should not be an
issue.

I agree with your "unit-to-unit variation" statement. The hole for the mic is very small. I wouldn't be surprised if the end of the hole towards the inside of the case varied from fully open, to partially closed, to fully closed. That would certainly be one explanation for widely varying reports of TX audio loudness.

Yeah, excellent point. I happen to already know the answer for my area, Chicago. It is legal to listen, just not make recordings of any sorts or use information for a criminal intent. I've been around police scanners off and on through out my life. Would just be nice to have something capable of that of my own.

We've been having increased problems with gangs around here. Several people around me actually have police scanners. I might try to get a few other locals to take up having a HAM radio over a 5 mile stretch in addition to communicating via the internet and positive loitering. Pretty sure the gang's won't think about getting a HAM radio and we could see if anyone else is noticing behaviors that need to be reported to the cops.

Becky.. you don't indicate that you have an amateur radio license.

Be sure that you and anyone else you encourage to get a "Ham" radio is
fully licensed. An angry FCC can be worse trouble than anything your local
gangs can think up. $10,000 and up fines, for example, for unlicensed use
of Ham bands.

Working on getting one. I'd also encourage anyone else who gets involved to
get one. We've already been working at local problems for over a year and
they aren't likely to end anytime soon.

This is a 2-way radio, not a scanner. Setup properly, it can surely be used as a scanner. Setup (and used) improperly could land someone in big trouble.

You do not have to program a transmitting frequency for a simplex channel. Once you program the RX frequency via the keyboard, your are done. You have a simplex channel (TX same as RX).

It doesn't matter what SFT-D and OFFSET are set to because they are ignored when storing a channel. They, therefor, can not prevent transmitting.

I know of no way that you can program this HT from the keyboard and prevent it from transmitting (if there is one, please share it with us because it would be tremendously useful). That is why I was so insistent for requiring a programming cable.

I use a BlackBerry cellphone. I have an app called Scanner Radio that I can use to listen to many police, fire, etc. Here in Indiana it's not legal for the general public to have a scanner in there vehicle. So in reality I'm inn violation. However in real life I never use the scanner app while driving.

If I pass my ham test next month, that changes. Hams, by state law, can have a scanner in their vehicles. At that point I probably will put in some local one on RX only. For now I have GMRS, MURS, local ham repeaters (RX only) and what I'm separately licensed for.

i find that the uv-5r pairs up very well with my th-f6a kenwood. i get the best range on both ends and the clearest rx and tx. when i use it with my tg-uv2 quansheng, the rx/tx range is much shorter and the rx on both ends is muffled. both the tg-uv2 and th-f6a are rated for 5 watts on 440 and 2m. havent tried it with my ft-250 or ft-270, as they are 2m, and i am going through a 440 craze right now. come to think of it, the tg-uv2 dosent pair well at all with the kenwood. short rx/tx between the two, with no changes to the radio.

Bob, my uv5r, which I have been using for about 3 months works fine with the internal mic. In fact, I am told that others can't tell if I am using a speaker mic or the internal mic. (Just my 2 cents worth.)

The internal mic on the UV-5R is totally useless. If you use the internal
mic your tx audio will be so low no one will understand a word you are
saying. You MUST use the mic/speaker combo that comes with the rig.

Maybe I am getting old and impatient, but I am having some difficulty figuring out the menu options for the UV-5R. Is there a summary or digest of what each menu option actually does, and a list of the options?

Second, I have programmed a list of repeaters using the programming cable and software, and this worked quite well. How do I get the labels I assigned to display instead of the frequencies? Thanks in advance.

I think the point is one should not have to drill a precise hole in a radio so compact. It should work. We got what we paid for. Thankfully, the external mic works.

here in MD, its not illegal to own or use a scanner, unless used in the act of a criminal offense. now, try to tell that to a macho security guard whos out to impress the ladies at the mall, and this becomes a fun issue. my wife and son are also hams, and this "joy boy" dosent know the difference between a scanner sold at the mall rat shack, an frs radio that comes in fun colors or a "real" radio. needless to say he called the police, and we were escorted out the mall. funny how he changed his story to the police, called me a liar and ignored our fcc tickets. a quick call to mall management a day later and now he dosent come within 20 ft of us. he said we were interfering with mall frequencies and operations....BINGO!!!! FCC alert!!!
and i spelled out the fines clearly to him and "promised" a fcc visit!! mall management welcomes hams with open arms now!!

Yeah, excellent point. I happen to already know the answer for my area, Chicago. It is legal to listen, just not make recordings of any sorts or use information for a criminal intent. I've been around police scanners off and on through out my life. Would just be nice to have something capable of that of my own.

We've been having increased problems with gangs around here. Several people around me actually have police scanners. I might try to get a few other locals to take up having a HAM radio over a 5 mile stretch in addition to communicating via the internet and positive loitering. Pretty sure the gang's won't think about getting a HAM radio and we could see if anyone else is noticing behaviors that need to be reported to the cops.

Peace, Becky (Chicago, IL)

In the beginning, the universe was created. This has made a lot of people very mad and has been widely regarded as a bad move. -D. Adams

I'm wondering if this is really a "drill a hole" kind of problem, or if the deviation setting of the radio is just too low.

Has anyone on the group actually checked their radio on a monitor or other test gear to determine if an average voice produces 4.5-5KHz deviation (FM wide)?

Of course, anyone who accidentally sets his radio to FM Narrow (2.5Kz) deviation will certainly experience apparent low audio, whether through a repeater or on simplex. And yes, I know that some repeaters and public service activities are now using FM Narrow. You'll sound fine there, but low anywhere else.

Bob, ive found through use, narrow band seems louder, both on simplex and through a repeater. currently im using wide band. go fish.... ive learned something today. have to check the tg-uv2 for fmn or fmw setting. Bob,

Yes. Mostly back in March and April when the group was just starting to become real active. Searching with the search term "deviation" I found message 550. It and the following thread is just one example.

Someone correct me if I'm wrong, except for HAM channels, we should be setting everything to NARRow. Right? Well, at least in the USA (sometimes I forget this is an international group).

Has anyone figured out if you can assign memory channels to the FM broadcast radio?....you can manually enter the frequency by punching in the frequency, but so far Iam unable to memorize it to the radio....the literature says it's possible, but I don't know how....

Interesting, Jim.

What I note is that the tests recorded 3.3KHz deviation, which is actually pretty low. Might account for some of the low audio reports.

I did not know the literature says it's possible. Have you tried programming the FM radio station with chirps?

Just a idea, food for thought I guess

Nope. Not possible. The FM broadcasts are done in a separate chip from the 'walkie talkie' chip. Read the thread "FM radio stations" starting with message 817.

Hi All, I thought that I was competent at connecting equipnment to a USB Port, but this one has me bluffed, Device manager says that the Prolific is OK and no orange in profile.

When running the Baofeng or Chirp programms and request to "download from radio" neither can get to the radio.

USB is of course always funny should I get an Rs232 serial cable and forget USB. My USB cable came with the Radio.

I recently purchased my UV-5R and when it arrived, I tested it and tried transmitting with audio, but no audio. I took the advice of others and cleaned out the mic hole in the case with a drill bit then also widened it out with the next size up drill bit. Now I have plenty of audio. I think that the case manufacturing process allows some extra plastic to be left behind in the hole. It's really not that difficult to do by hand with drill bits, and the process works great. Of course, if operation with a speaker mic is desired it's an easy way to solve the problem too.

These are great LCR's.

Hi Jim,

I reamed out the mic hole with drill bits from outside the case. If anyone tries this, just take it SLOW, and it's really easy to do. As you are twisting the drill bit in your fingers grasp the bit very close to the end of the bit so that it can't go in any more than necessary, and just bring it back out as you are twisting, and you will bring the extra plastic along back out with the end of the bit. Do this several times with the same size bit, then when it's cleaned out start with the next size up if you want to enlarge the hole a little more. Just take a little at a time.

Drilling the hole is not that difficult. Just be careful. Putting a stop on the drill bit about 1/16" from the tip is also a good idea. I did this successfully on my Feidaxin and it cured the low audio problem.

I think the point is one should not have to drill a precise hole in a radio so compact. It should work. We got what we paid for. Thankfully, the external mic works.

On Sat, Jul 7, 2012 at 11:23 AM, Ron Austin <ronaustin@...> wrote:

I have been reading this group for a couple of weeks now and many have reported that their 5R works great in both TX and RX. I have not used my 5R much yet, but so far I am very happy with it. There have been some reports of low volume when you transmit. Once solution is to drill the mike hole out. Obviously you have to be very careful when doing this.

The internal mic on the UV-5R is totally useless. If you use the internal mic your tx audio will be so low no one will understand a word you are saying. You MUST use the mic/speaker combo that comes with the rig.

You cannot program the FM stations. However, just punch the numbers of your desired station in. Then by using the up/down arrow keys you can step through the stations the radio hears. Pretty slick.

Has anyone figured out if you can assign memory channels to the FM broadcast radio?....you can manually enter the frequency by punching in the frequency, but so far Iam unable to memorize it to the radio....the literature says it's possible, but I don't know how....

Agreed. Just as a car, used improperly, can land someone in trouble.

I fully respect your position. I do not have a programming cable, so I could not comment on that. Others did, which was good. I commented on the other method.

My interpretation of the question was that the original poster wanted to listen now. Entering frequencies "by hand" is reasonably simple and does not require a purchase or a wait for a cable.

Many public safety radio channels are duplex, so programming the repeater output without the input or tone would make it very unlikely that anyone could interfere with official communications.

Even communications on simplex frequencies are generally guarded with ctcss (often called PL - trademark Motorola). If someone transmits on a simplex frequency without the proper ctcss tone, the likelihood of interference is very low.

But I will repeat your message so that everyone gets it: DO NOT TRANSMIT on public safety frequencies without permission. It can get you into a lot of trouble.

I've used it a few times, kinda thought it was a silly feature.

Then the power went out and I was darn glad for the radio. Even the flashlight came in handy. Maybe there's more to this LCR than I gave it credit for.

The fact it switches from FM broadcasting to whichever frequencies you're monitoring is very cool.

It does seem that since this little sweetie costs about the same a as carton of cigarettes more units will start to show up transmitting where they don't belong.

That aside, as a scanner I think that it would work great and at about 1/2 the cost of the closest competitor. For those who do not have a license
to operate on any frequency, these units will work on the 5 MURS freqs that do not require a license. The radio should be set to low power for this operation as 2 watts is the limit. These units could be used in the Chicago area without fear of wrongdoing provided they were pre-programmed.

And I do believe that we are still free and can "listen" to any transmitted signal. What we should not do is convey what we hear as that may get one into trouble. How a mall guy could keep you from enjoying your radio is beyond me.

yeah, I've wanted a police scanner for awhile, but a decent one will run you over 100. My dad found a cheaper one on ebay at one point, but it didn't come with a charging cable and eats batteries quickly (have since gotten it a cable).

I plan on pre-programming a lot of stuff. Still waiting for it to show up.

4084. LCD Has Developed Fault

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-08 06:21:08 UTC
From: stephen.stebbing
Topic: 4084 Message: 4084

Hello All,

My radio has developed a fault whereby the last character on each row of the LCD show only a few of the dots.

If I squeeze the case just below the LCD, the missing dots appear - but only whilst I'm squeezing.

Would anyone have advise on how I might fix this problem?

Thanks,
Steve VK2AAV

The radio is down to 50 bucks--spring for another one. Maybe you'll get a later firmware, and can sell the black one on kijiji or keep it for a spare. Just a thought.Ian

I've just ordered one of these UV-5R transceivers, as a cheap return to the hobby after an absence of several years. I've seen on ebay that an extended (3600mah) battery is available. Does anyone have experience of this battery, and give an idea of the expected battery life per charge, both for the standard and the extended battery?

Dave and All:

To be more specific, you can interfere with on-going communications even if you don't have the correct PL, but it depends on what you call interference.

If you transmit on the "input" frequency of a repeater that requires a certain PL tone and you don't have that, you will not key up the repeater. However, if someone is currently using the repeater and you key up on the input frequency, you can can interfere with their signal into the repeater. How severe that is depends on how strong your signal is vs the other legitimate user's signal. If your signal isn't very strong vs theirs, then there may only be some mild mixing products or distortion caused. If your signal is stronger, you could make their transmission illegible or even prevent the PL on their transmission from being decoded, which would cause the repeater to drop the transmission.

The same is true on the repeater "output" frequency. Since repeaters generally transmit from higher locations and often with much more power than a UV5R, you may only be able to affect those receiving the repeater who are close to you. The effects will be the same ranging from mild mixing and distortion to completely overwhelming the signal and causing the user's receiver PL decoder to stop decoding the PL from the repeater.

So, I certainly agree with Dave that you should NOT transmit on unauthorized frequencies and you should therefore NOT setup your radio to be able to do that. Accidents happen and it would be much more than embarrassing if you managed to engage the transmit button on your UV5R somehow by accident (stuffing it in your pocket with other things in there) while you were in the proximity of public safety users you're monitoring. In that situation you could easily overwhelm their ability to communicate.

If you can program the radio to not transmit on channels you only want to monitor, that's the best. If you can't, program the transmit frequency to some frequency you are permitted to use that gets little use. At least that way, it will only be embarrassing.

One area of the radio spectrum that we are specifically prohibited from listening to is cellular phone channels. Some scanners used to come with a "NOTICE" advising users NOT TO LISTEN between such-and-such frequencies in the 869 to 894 MHz area. Before that was the law, I had some pretty good times listening to cellular conversations. (But that was a long time ago).

> How a mall guy could keep you from enjoying your radio is beyond me.

People in certain positions of authority but who don't know anything about radio can be afraid of it. As long as you don't wave it in their face, using a portable radio in a shopping mall should not be a problem. If you do get challenged, KEEP YOUR COOL, as the earlier poster mentioned, and you will prevail.

4094. Charger and temperature questions?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-08 15:56:00 UTC
From: aggieoutlaw
Topic: 4094 Message: 4094

Two questions for the group:

1) Is it okay to leave a spare battery on the charger? Some charging systems are intelligent and transition to trickle charging when fully charged. I suspect this Wouxun is not intelligent...but I've been impressed/surprised by the device thus far. Most Li-ions don't self discharge too badly so it may be a moot point. Has anyone tested the capacity after weeks off the charger? I just want to make sure my spare is good to go when I need it.

2) I purchased the battery eliminator for my vehicle. I'm considering leaving the radio (or buying a second UV-5R and leaving it) in my car all the time. I suppose it can reach 130*F in my car mid day. Heat is obviously bad for the battery but that won't be installed. Heat is also bad for the LCD but they tend to recover. Anyone see any issue with leaving the HT radio installed permanently in my hot car?

Hi,

There are those here on the list that know a great deal more than myself, I am just going to tell you what I have come across with this gem of a LCR. To answer your first question. When you charge the battery it will flash green and red with no load on it and green when it's fully charged and I guess flash red if there is a error or been on the charger to long. Instead of keeping just one spare. Cycle each battery (it's better for the battery and promotes a longer life span for the battery it self.) I use my 5R daily and find that the battery last about 6 days. I would say that if you cycle each battery when you need it. It will be there. I have let mine set unused about 2 weeks and turned on the radio and when I turned it on the battery was full. It took about 3 weeks once my radio was shipped to arrive. When I got it thinking the battery was totally discharged I put it on the charger and the LED on the charger went green in about a minute and I used it for about six days before I had to charge it for the first time so all told I guess that would be about four weeks.

On the second question I use my 5R mobile as well. This little radio Hates heat of any kind. I went with and SMA to BNC connector (all of my antennas are BNC.) I keep my mag. mount on my van all the time. When I go mobile I just hook up the antenna and I am good to go. You can keep one in your car all the time. I don't but that's me. This little gem does work great mobile. Were talking about a $50 radio one can replace it pretty easy. If you keep it your car shade it somehow. Under the seat or something. I have put my 5R in thermal shut down once and once it cooled worked just the same. I don't know how many times I would want to push it before I just plain kill it with heat. That said, this is a affordable H.T.

Subject: [baofeng_uv5r] Charger and temperature questions?

Two questions for the group:

1) Is it okay to leave a spare battery on the charger? Some charging systems are intelligent and transition to trickle charging when fully charged. I suspect this Wouxun is not intelligent...but I've been impressed/surprised

by the device thus far. Most Li-ions don't self discharge too badly so it may be a moot point. Has anyone tested the capacity after weeks off the charger? I just want to make sure my spare is good to go when I need it.

2) I purchased the battery eliminator for my vehicle. I'm considering leaving the radio (or buying a second UV-5R and leaving it) in my car all the time. I suppose it can reach 130*F in my car mid day. Heat is obviously bad for the battery but that won't be installed. Heat is also bad for the LCD but they tend to recover. Anyone see any issue with leaving the HT radio installed permanently in my hot car?

Here is a link to a black replacement case, for $8.

http://www.409shop.com/409shop_product.php?id=108578

They also do it in camoflage.

If you really need it to be red or flourescent), why not get a can of aerosol autopaint...?

Hi,

The ABCD tones are n the top row of keys, menu, up, down, and exit. They send (on my radio, anyway, maybe fixed in later revisions--anyone care to confirm?) A, C, B, and D, respectively, yes, in that order. As I say, it's possible that Baofeng corrected this in later revisions so that the tones go in order A B C D, but my radio has it the other way.

4105. 2 Meter DX....

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-08 18:12:57 UTC
From: kg4uuj
Topic: 4105 Message: 4105

I was walking around downtown Paducah, Kentucky, yesterday during a thunderstorm with my UV-5R when I heard a Net on the local repeater asking for check-ins. I gave my call to the Net operator and he asked for my location. I told him that I was on 4th and Broadway. He came back and asked me what city I was in and I responded with Paducah, Kentucky. With laughter from the other end he told me that I was talking to a Net in Battle Creek, Michigan. We were able to talk for about 5 minutes before I lost his transmission. I just checked the distance on Google Maps and its about 500 Miles.....ON A BAOFENG UV-5R @ 4 WATTS!!!!!

I never thought my first DX would be made on 2 meters....just goes to show the power of the weather.

Just had to share my story.

Tom,

According to Buddy's "baofeng-uv5r-eyes-free.rtf" in the Files area, they are not missing, they are just not labeled. Quoting from the guide...

"This keypad, however, isn't exactly traditional in its layout. The top four buttons are the "menu" button (used to open the settings menu), the "up" button, the "down" button, and the "Exit" button. In transmit, these buttons send A, C, B, and D DTMF tones, respectively. Below these, you will find (left to right, top to bottom): 1, 2, 3, and scan/reverse (which is also the star key); 4, 5, 6, 0; 7, 8, 9 lock (which sends pound)."

I'm not sure but "B" and "C" might be accidentaly swapped in the guide. I'll check with buddy.

I don't believe the radio can work as a cross band repeater. That would require it to receive while transmitting as the demodulated input is fed to the transmit modulator.

The radio can not listen while it is transmitting, therefore it can't do cross band repeat. The radio can't even listen to two channels at the same time. The best it can do is quickly cycle between two frequencies monitoring for a signal. When it sees a signal on a frequency, it stops on that frequency and outputs it.

What this little $50 radio can do is operate on dual-band splits. You can program to receive on one band an transmit on the other like is needed from some satellite work. Even in this mode, the radio is either receiving or transmitting. It can't do both at once.

(BTW, I would love to be proved wrong on this.)

Thanks Buddy,
Comparing the sound of the keys of my UV-5R to to my Icom TH-F6a, I would agree with your assessment of [UP]=C and [DOWN]=B, but I'm not sure about [EXIT]. My [EXIT] key sounds nothing like the D key. I'd say the [EXIT] key of my UV-5R is the same as the 0 [zero] key. Anyone else with the same result or is it just my HT?

Hi Jim,

Your tones sound like my tones. Yes, the D key sounds like a 0 on the sidetone, but I promise, it really does send out a D, in spite of what you're hearing locally. I ran it through a repeater that has DTMF readout and the key that sounds like a 0 but isn't definitely read back as a D. Even though it sounds wrong out of the UV5R speaker.

The UV-5R will operate cross band- ie Tx on VHF and Rx on UHF. I did not read your question as can it be used as a repeater, but it will not operate as a repeater. In case you did want to use it as a repeater, TWO UV-5Rs could be configured as a cross band repeater if you either build a PTT drive circuit or use VOX on the Tx radio.

It's nice BUT all "work" was done via your local repeater.... it is not a direct QSO with your 4w UV-5R and a DX station....
Anway, I'm sure it was a enjoyable contact ! Congratulation on your first DX via repetater on 2m !

Hello!

The other day I was testing / playing with my UV5R and a 1/4 wave 2m HT antenna I picked up a couple of years ago. It's pretty much a straight piece of wire connected to a BNC plug then coated in black plastic. I've used the radio before on my son's Woxoun UVD1P for both 2m and 440 and it works both bands better then that stock antenna.

Anyways, as I was testing on the repeater, the repeater owner came back and said I had a nice signal and that the radio sounded really good. He then asked me what brand I was using. He thought it might be converted Moto or possibly a Yaesu. I asked him why, and he explained that the radio was running "reverse burst" (Squelch Tail, STE) which most HAM radios don't have.

I then asked him what it was, and he gave me a quick explanation and a demo. (Here's an explanation I found on the web: http://www.repeater-builder.com/rbtip/reverseburst.html . I gets real repeater-related technical fast.) The basic idea is that when the transmission of the radio is done, a short Squelch Tail is sent. This causes (repeaters so configured) to immediately mute the output. Got that? I didn't until he demonstrated.

First he did a transmission on his non-STE radio. When he was done, there was the customary burst of white noise. Then he did a short transmission on an STE enabled radio. This time, there was no burst of white noise, even out to the repeater dropping. So basically, the STE feature will eliminate the white noise at the end of transmissions when used with repeaters set up for it.

Programming item 36, RP-STE sets the length of the tail. I don't see an option for setting it in Chirp (yet), and I don't feel like booting into Windows to check the Baofeng software.

Congratulations Mike, really good DX, and really good Tropospheric duct.
In my case, some day after an earthquake about 5 Righter magnitude, I
turned on my radio for listening what's happening.

My radio had an "experimental" Motorola/High Gain VHF mobile magnetic
Antenna, over the balcony in horizontal position and without ground
planes. Suddenly I heard a station in simplex mode calling to other
stations about 634 miles away from him.

I thought it was a local station in a very high location calling DX, and
I asked to him for this big challenge with only 10 Watts in my antenna.
Big surprise was when he told me, he were 240 mile away from me, in a
not so high position with the same lo power than me. :O

The duct was for about 30 to 45 minutes and has been impossible until
now to repeat this very nice QSO. It's impressive to think about the
mysteries of the mother nature. Each time we had been in between an
earthquake, something similar happens. 73 & good DX.

Fernando

4119. Question about Dual Watch

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-08 21:03:19 UTC
From: dawnfelicidario
Topic: 4119 Message: 4119

Lots of great tricks and tips here. The advice about menu 34 selecting which group "A" or "B" to transmit on while using dual watch is GREAT!! The question I have is can you set group "A" to monitor and TRANSMIT while group "B" is scanning? It doesn't seem to allow you to set menu 34 while one of the groups is set to scan. I'd like to set group "A" to stay on my EMS channel while group "B" scans through all the frequencies i have programmed. Is this possible?

Thanks for the help
Stephen

You can't get there from here- The 'selected' A or B is the Scan, so if you set up A to monitor and Tx, then Scan will use A. Maybe just buy a second radio to use for EMS.

There is a link on radioreference, however they can only stream the typical comms. TAC and all the good stuff is not allowed. There is also quite a bit of delay. I've seen Android scanner apps but have not tried them. Right now, the PRO-106 is on sale for $325 and the 197 for $350. There is a $50 rebate if you put it on an RS credit card.

The blocking of the old analog cell phone frequencies should be abolished, as most all the AMPS service is long gone and replaced by CDMA/TDMA systems and the old frequencies are being used by public service and private sector users.

Besides, the cordless phone frequencies were juicier!!!

Folks, lets be practical here. We all love our Baofengs or we would have sold them.

Get yourself a mobile radio and mount it properly. All the plugging and unplugging the radio all the time will wear it out and the real mobile has more power to get in when you need it, and if you don't get an RS HTX mobile, you will hear better, too. Front end overload happens real easy to this HT. Mine screams on FM for a few seconds with this radio tower outside my QTH, forget 2 meter recv, it's deaf...

--- On Sun, 7/8/12, aggieoutlaw <brad.s.jones@...> wrote:

Two questions for the group:

1) Is it okay to leave a spare battery on the charger? Some charging systems are intelligent and transition to trickle charging when fully charged. I suspect this Wouxun is not intelligent...but I've been impressed/surprised by the device thus far. Most Li-ions don't self discharge too badly so it may be a moot point. Has anyone tested the capacity after weeks off the charger? I just want to make sure my spare is good to go when I need it.

2) I purchased the battery eliminator for my vehicle. I'm considering leaving the radio (or buying a second UV-5R and leaving it) in my car all the time. I suppose it can reach 130*F in my car mid day. Heat is obviously bad for the battery but that won't be installed. Heat is also bad for the LCD but they tend to recover. Anyone see any issue with leaving the HT radio installed permanently in my hot car?

From: jziggity12
Topic: 4143 Message: 4143

For those interested:

On the advice of another poster a short time ago, I went ahead and purchased a TYT BCG-F8 charger as a replacement for the original Baofeng one that crapped out on me. (I guess I must have made the dreaded "chareto mistake." Ha ha.) It took 9 days total to ship from 409 store, at a price of $13.50.

The TYT charger seems to be built a little better. The contact springs are tighter/have more resistance pushing against the battery than the Baofeng. The radio fits into the TYT charger noticeably more snug too.

The directions on the bottom of the charger are much more clear too and the decal on the front over the LED seems of a higher quality.

Here are how the electrical stats compare:

Original Baofeng wall-wart:
Output DC 8.4 volts at 600mA, center pin negative (also has the LED on the front of the wall-wart)

TYT wall-wart:
Output DC 12 volts at 1000mA, center pin positive (no LED on the wall-wart)

Original Baofeng tray:
Input DC 10 volts, output DC 8.4 volts at 400mA

TYT tray:
Input DC 13.8 volts, output DC 8.6 volts at 40-450mA

Those are just the stats printed on each piece of equipment, I didn't actually make any measurements with a multimeter to come up with them. Even though the wall-warts are noticeably different electrically, the outputs of both trays are nearly identical, so I guess by the time the juice is getting to the battery, it's all good!

The TYT charger fully charged a dead battery in about 2 hours, and everything seems to be working just fine, for those who are looking for something a little better than the original charger.

Okay, played 50 tries with the bogus cable for programming and have the v3.2.0.0 ; so got that far - I think I can actually use the import cable.

Loaded CHIRP 0.2.2 (GTK 2.24.10 PyGTK 2.24.0
Python 2.7.2).
Did I do it right so far?

Start Chirp, set my COM port # and Baofeng but it only has the UV-3R as a choice - UV-5R is not a choice- this correct?

Now when I try a 'read from radio' I get a warning that it did not acknowledge command.
2 hours of frustration; suggestions before doorstopper?
I read the info, but apprently I missed something with W7/64 computer from hell.

Enter your vote today! A new poll has been created for the
baofeng_uv5r group:

How would you rate the performance of your UV 5-R? How often do you use it?

o Very good performance
o Good performance
o Acceptable performance
o Somewhat poor performance
o Unacceptable performance
o I use it everyday
o I use it often
o I don't use it often
o I don't use it
o I'm looking to replace it.

To vote, please visit the following web page:
http://groups.yahoo.com/group/baofeng_uv5r/surveys?id=2735887

Note: Please do not reply to this message. Poll votes are
not collected via email. To vote, you must go to the Yahoo! Groups
web site listed above.

Thanks!

You've got me confused. I googled "Lynux" and came up with zero.

I'm going to assume that by "Lynux" do you mean linux, and by "ver 10.10" you mean the October 2010 release of Ubuntu. I apologize if I have it wrong.

By searching the group with "linux" as the search term, I see several individuals that are using CHIRP on their linux based computers.

On the CHIRP website Documentation page there are links for information on running CHIRP on both MacOS and Linux systems.

Hi jziggity12,
I was just thinking about this over the weekend and wondered how it came out. Thanks for taking the time to do such a well written comparison. I will be ordering a TYT charger as soon as I get done typing this message.

And by the way, the wall-wart supplied with my Baofeng charger matches the description of your TYT wall-wart.

Come on. What's not clear about "Prevent cooks meals or is injured, only battery assigns carry on the charge."? ;-)

Thanks again,
Jim KC9HI

Yes on Fedora 15. It works great. At one point gpsd got enabled on my desktop and it would steal the TTY. I kept getting "resource unavailable" errors. I had to disable gpsd to make it work again. You may need to either modify the permissions/ownership of the TTY or run CHIRP as superuser.

I forgot to mention that the LED operation on the TYT tray is much simpler too. When the tray is plugged in without a battery or radio installed, it shows green. Putting the radio/battery in to charge it will change to solid red until charging is complete, then back to solid green again. None of this rapid blinking "I'm not sure what color I want to be" nonsense.

Noel,

Don't laugh, but I had to write to the radio before it would let me read.

Fortunately, I have several UV-5R radios, so I was able to write to another radio, and then swapped the cable to the radio that I wanted to read.

If you don't have a second radio, try to do a write to a non-existent radio and then after it fails, plug in the radio and try to do the read.

Thanks & 73,

Gordon Beattie, W2TTT

Subject: [baofeng_uv5r] New Member just got UV-5R

Hi All, I thought that I was competent at connecting equipnment to a USB Port, but this one has me bluffed, Device manager says that the Prolific is OK and no orange in profile.

When running the Baofeng or Chirp programms and request to "download from radio" neither can get to the radio.

USB is of course always funny should I get an Rs232 serial cable and forget USB. My USB cable came with the Radio.

From: J.Gordon Beattie, Jr., W2TTT
Topic: 3964 Message: 4156

Hi Folks!

I noted that on one of my UV-5Rs, that one of the screws wasn't catching the inset to hold it to the back of the radio.

The solution (surprise!) was a bit of Crazy/Super Glue in the hole and under the plate. I did this with the battery removed so that there was no tension on the assembly while it cured. Worked great!

Be careful not to get any glue into the battery clip release assembly! :-)

Has anyone else found this problem and how did you resolve it?

Thanks & 73,

Gordon Beattie, W2TTT

I'm sure that if we knew the 'code', the UV-5R's charger signals would be useful. Until then, "nonsense" is a good description.

Here's what I think I know...

Solid Green with Pulsing Red (not to be confused with alternating Red/Green): Charger empty or charging error.

Solid Red: Charging

Solid Green: Charging cycle complete.

Here's what I don't know...

Alternating Red/Green: ???

Anyone know what this indicates? It always happens between Red (charging) and Green (charging complete). At first I thought it was an error until I read in the manual that 'error' is 'solid green with pulsing read' as noted above. Could it mean "I'm not done yet but I'm far enough along that you can go ahead and take me if you have to"? Someone mentioned recently that the center "T" contact in the battery might be a temperature signal form the battery. Could this be a high temperature warning? I don't remember ever taking the battery out of the charger and it being hot (or even warm) though.

Had the same issue on my UV-5R. Once of the screws that came with the radio would only grab a couple of threads and would not stay.

Ace hardware, metric specialty bolts section. M2.5's They may seem a hair long but work perfect. Clip is now solid as can be on the radio.

And it's something I noticed a few times now. I carry my UV-5R's securely attached to my jeans while walking the dogs. Good belt clip, so far so good.

When I listen in to a local 70cm repeater, all is fine. When listening to a local 2 meter simplex QSO while walking (we're talking very strong signals here), I notice a crackling noise of sorts out of the speaker. This apparently happens only when the antenna rubs against my clothing. When I hold the UV-5R in my hand while walking, the problem disappears.

The noise also disappears when I exchange the stock antenna for a Nagoya NA-701, my favourite 3rd party antenna. My best guess is that the stock antenna is prone to static charging when rubbing against clothing, and the result seems to be especially noticeable on VHF. Anyone able to reproduce this?

Also: when I detach the UV-5R antenna, hold it next to my ear and shake it a bit, I can hear a rattling noise. I have no idea if both observations are related. I have two UV-5R's and they behave the same.

The installation is an exacting process and glossing over the finest detail can lead you astray. You also need to make sure you clean up well after unsuccessful attempts.

One of the problems is that your system is actively working against you. It WANTS to go out and find the new non-working drivers. You need to be sure that you stop the system from doing this. I can't vouch for all the different system versions, but on Win 7, the attempt to update happens quietly and can easily be missed.

Barring a defective cable, it will work.

Not referring to your computer- Always Read the RADIO first and save a copy- then write. Are you still not working? It can be done- just seems impossible sometimes. Do you have FindComPort.exe- great for com port troubleshooting. Let it verify the port number assigned to your cable and then use that in the programming software. Sometimes it takes a radio power off on or a unplug plug the USB to bring everything to life. I have two XP machines and have made Vista and Win7 program OK and all have their quirks. Once working they are pretty solid. I program Motorola, Kenwood, Wouxun,and Baofengs on a daily basis.

Suspect the crackling might be due to loose connection internal to the antenna.

Hi John,

not impossible, but highly unlikely - two out of two antennas, and only 'defective' on VHF, not on UHF, and only 'defective' when carried around with a belt clip, but fine when held in my hand?

Hans:

I think we need more information.

When you say "crakling noise" do you mean the signal is noisy as if you were farther from the signal source or is it some other type of noise?

I ask this because the effectiveness of the antenna is more reduced on 2 Meters than on UHF and it's even more reduced when it's next to your body than when you hold it in your hand. It's also possible that your other favorite antenna is simply a better antenna so it's getting more signal than the stock antenna, even when it's next to your body.

So, if you hold the radio in your hand while listening to a signal and wiggle it or tap the antenna with a finger on your other hand, do you get the same kind of noise you're concerned about? If you wrap your other hand around the antenna, do you then start to get more of this noise?

Keep in mind that the least efficient configuration for 2 meters is going to be with the radio on your belt and the antenna right next to your body.

Is the programming cable for the uv5r the same as for the Kenwood HT's? It fits the uv5r but I cannot get the software to read the radio. Com port is correct, cable works with the Kenwood HT so I know the cable is good. Any suggestions will be appreciated.

Should be. I program my uv-5r and my Kenwood with the same cable. Took me some frustration before I realized the cable doesn't go into the Baofeng easily.

I use the same cable for UV-5R, KG-UVD1P, and Kenwood TK-3302U.

I have noticed something similar when I sit the radio down versus holding it, but I think that it's actually a sensitivity to impulse noise that goes away when you hold the radio, probably shielding or damping some RFI or just providing a better "ground".

dockscience:

Yes, it's more a matter of not having your hand on the radio. When you're holding the radio there's capacitive coupling to your hand that provides more of a "counterpoise" for the antenna. This is also what things often called a "Tiger Tail" do for you.

The Tiger Tail is a wire that has a loop on the end that will in some way fit under the antenna connector on the radio to provide it with a connection to the antenna connector shield. The wire then hands down from the radio to provide a better counterpoise. This would be helpful if you have problems hearing things when the radio is sitting on a table that you can hear better when you're holding the radio. You could also use a clip-lead or anything that can make a connection to a body ground on the radio.

Keep in mind that the antenna on a hand-held radio is most often just one side of the antenna. The radio, your hand, and whatever provides the other side of the antenna (often called the counterpoise but really part of the antenna.

For you it's probably not a matter of less sensitivity to impulse noise but a matter of more signal. Less of that kind of noise gets to the discriminator in an FM receiver when there's more signal. That's one of the nice things about FM.

How many of us has had problems with the units screen going out!!!!
Tried to send the radio back to Baofeng, You have to get them to send you a certification to place on your box to send it back to china, Only if you could send them email it just keeps sending back not deliverable!!!

Tried calling their phone numbers don't work???? Why???

Bought the unit at Breezeshooters Hamfest in Butler Pa on 6-3-2012
and only used the thing a few days.

The dealer at the hamfest said all you have to do if you have problems within a year is send it back and they will fix it or give you a new one.

sounds like buyer beware of baofeng!!!!!!

any help on this matter let me know. please.

This is common problem. Unfortunately mine does it. Not just the stock antenna either.

Message 2272 is a thread where it is discussed.
http://groups.yahoo.com/group/baofeng_uv5r/message/2272

I'm almost positive that it was discussed back in late March or April by one of the fellows that took his apart and suggested some mods to fix/improve a few things. If I can find it, I post it as well.

Download FindComPort.exe from www.wouxun.us and use it to verify the Com Port number assigned to your cable. Then use that port number in the programming software. If the port number is too high, use Win Device Manager to change it. Also make sure the two pin radio plug is FULLY plugged into the radio.

Hi,

All I've heard is that if the unit overheats either by the Sun or use and that the LCD screen may drop out..... this is sort of normal with this type of screen. Most come back, some don't if the exposure is severe..... had a electronics store for 17 years saw some but not much.

I am not sure about ANY of the Chinese companies. Some of the sites that I visited have very old info on them. Today I visited Wouxun as they have a "new" mobile that is going into production this month trying to find out more info..... their "news page" was from 2009 and 2011 ??

If you have a dead unit you may be one of the very, very few but after a lifetime in electronics I would not be at all surprised if it was withing the first 30 hours of use.

Let it cool and see what happens.

John

Here's an earlier message than the one I was referring to: 1151

http://groups.yahoo.com/group/baofeng_uv5r/message/1151

The first mention of the popping was message 1108 on April 7 (part of the same thread above).

http://groups.yahoo.com/group/baofeng_uv5r/message/1108

The message that I was referring to was 1253 where Dave takes his UV-5R apart to try to find a solution.

http://groups.yahoo.com/group/baofeng_uv5r/message/1253

How about telling us a little bit about your setup.

After you plug in the cable to your computer, what does Device Manager show for the Prolific cable? What version does Device Manager show for the the Prolific driver. What does it show at the COM port?

You have to get the programming cable sorted out before you move on to the software. By the way, what software are you using (Baofeng or CHIRP) and what is the version?

Hello All,
I have had my UV-5R confiscated by authorities because it can transmit outside the ham bands in Australia.
Is there anyway to lock down the transmit frequencies, or failing that lock down the range of both bands completely including RX?
I notice in the V2 software the band ranges are in a field but they are greyed out and un-editable.
Any suggestions most welcome!
Thanks,
Murf,

Most definitely screwed up, that's just asinine. I don't have any ideas
on locking it out.

Does Australia restrict sale of surplus government radios?

Hope you can get it sorted out.

and a fundamental misunderstanding of the Australian legislation too.

Possession of a radio that can transmit beyond a licence frequency by itself is not unlawful.

Take a look at section 73 (from memory). The actual offence the inspector needs to prove is possession with intent to use the device outside the licence conditions. Intent is a very difficult charge to prove.

Was it customs that confiscated it, or the radio regulators? I don't know what pertains in Aus, but would it help to be able to point to transmitters from some of the more established manufacturers, that are also capable of transmitting outside of AR bands?

in fact I doubt there are any commercially manufactured transceivers
that would satisfy this test in Australia. Even HF rigs extend beyond
our band limits in some areas and these days, nearly all include a 60
meter band that we simply don't have available to us.

I think you need to go back and have a very close look at the Act Bill. No misunderstanding at all. The UV-5R is a commercial radio which is not compliant in Australia, ie it is a Non Standard radio.

Possession of Non Standard Devices is an offence under the Radcoms Act.

There are a small number of Amateurs who think they can possess anything they want. That is simply not correct.

Cheers
Jack

It was the inspector that confiscated it.
I have found the way to restrict TX on it so I am hoping they will return it, I will let everyone know the result.

I stand by my comments Jack. It is non-compliant for commercial purposes
and I have no argument with you there.

But it is not and indeed cannot be non-compliant for use in the amateur
bands.

4212. Repeater Problem

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-10 13:05:27 UTC
From: Bob
Topic: 4212 Message: 4212

I programmed the UV5r with the software, when I attempt to use the radio through local repeaters there is no rf output until I let off of the PTT, then the repeater is 'kerchunked', WHAT AM I DOING OR NOT DOING that is causing this condition??

4213. Chirp

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-10 13:20:45 UTC
From: Charles
Topic: 1211 Message: 4213

I have used the 'stock' software to read and write to the UV-5R successfully, but I thought I would try Chirp since it runs natively under OSX instead of Windows. The setup read the radio configuration perfectly. I made a few small changes to do a test upload, but almost nothing happens. The dialog 'clone' comes up but shows no progress and disappears immediately. Nothing was changed on the radio.

Has anyone else encountered this problem, and if so, what is the fix?

73,

Chas

It sounds like you are transmitting to the repeater. When you Tx to the repeater, it keys up and when you release PTT, the repeater drops out and you hear the squelch tail kerchunk. What are you using to listen to the repeater while you transmit? I suspect you are working and don't know it.

Topic: 4194 Message: 4216

Jim,

Has just been tested and it works. Program the radio as follows:

For Australia: 144 - 147 (allows 144.000 --> 147.995)
For Australia: 430 - 449 (allows 430.000 --> 449.995)

Why 430? Listen to the WIA News of Sunday, 8/7/12 and read the July 2012 edition of Amateur Radio.

In VFO mode the radio will NOT be allowed to work (receive and transmit)outside the programmed ranges - making the radio "Acceptable" to Sections 46 - 49 of the Radiocommunications Act (1992) and current practises as described to us in numerous briefings with ACMA officials.

Note that one MUST have the "standard" Baofeng UV5R software installed first - otherwise necessary ActiveX controls will not be found.

Bob:

Are you trying to hear your signal come back from the repeater on another radio? If so, you are probably "desensing" the other radio with the transmission from your UV5R so it can't hear the repeater until you stop transmitting. If that's what's going on, move farther away from the other radio and try again.

4220. After some time - just not impressed

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-10 17:14:34 UTC
From: dallience2002
Topic: 4220 Message: 4220

For those that haven't purchased the rig just yet I thought I would share a few thoughts. For those that have, like myself, well, it's an okay rig, just not on par with Icoms or Kenwoods. But, it costs a whole lot less and that's why I purchased it too.

I have an Echolink station set up here and was doing some feedback testing to see what the audio quality was like to my own ears rather than relying on other ears and also to compare the "ear quality" impressions to an Icom HT I have here.

Massive difference between the two. The Icom is crisp, the Baofeng much less sharp. I tried speaker mics as well as the built in mic. Same quality difference.

The only other issue that I've found very frustrating is the squelch threshold. My Icom and Kenwood HTs will happily break the squelch when a signal comes in. The Baofeng very rarely unless the incoming signal is extremely strong. The green light will come on but it will be silent. I've adjusted the squelch settings from 1 to 9 with the same result.

I have some other issues here and there, but for $50 it's okay, just much inferior, to me, to my ears, than the other rigs.

I'll keep it in the car, or the shack because it's easy to grab and it does work, but I won't be purchasing another one.

Dan

I cracked the glass on my UV-5R. I figured I'd just live with it as surely a replacement part would cost more than the radio is worth. After a little research I found I could order just about any part on the radio, and the price is amazing. I ordered my glass for a whopping $2.

Shipping is free with a $16 order (actually its free no matter what, and the minimum order is $16. I put an extra battery on the order to get th price I wanted, and ordered a couple of the glass's since the price was right.

Try replacing a part on a kenwood for $16

Man I love cheapchinajunk!

4223. Chirp 0706 version: +/- OFFSETS not setting?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-10 17:17:15 UTC
From: toledohamradio
Topic: 4223 Message: 4223

Thanks to your help here, got the cable and Chirp loaded; issue I'm having is that despite going into EDIT, and setting the OFFSET (+/-) it is making all my channels simplex and not allowing me to save the repeater offsets. Is this a bug in the 0706 version or am I not doing something correct? I assume you input the receive frequency, the offset frequency and the + / - offset. It's the +/- positive/negative repeater offset that I can't get to save to the radio. It shows +- only for all channels.
Thanks and 73
John

I don't like battery save. I've heard it does exactly what your describing. I'm sure battery save gives you extra battery but at what expense. If your worried about battery life, buy a spare or two. They are cheap and sooner or later you'll find you forgot to charge yours and then what do you do. I also keep spare radios for the same reason.

4233. UV-5R with Nagoya NA-775

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-10 21:00:01 UTC
From: jaminor
Topic: 4233 Message: 4233

I just installed a Nagoya NA-775 antenna on my UV-5R. Big improvement, this is a much better antenna than stock and much more flexible. I can hit repeaters from inside the house that weren't possible with the stiff stock duck.

There was a gap between antenna base and radio, but a trip to the plumbing section and the purchase of a #83 O-Ring fixed that (#83 is 1/2" OD x 5/16 ID x 3/32") This washer filled in the gap perfectly and looks factory.

I second the recommendation of the NA-775, but with a caveat.
There are multiple antennas claiming to be a "Nagoya NA-775" about. Some are 39 or 40 CM long and have blue stenciled markings. Word has it these antenna are counterfeit, and terrible. There are also some 39 CM antenna with the "correct" Nagoya sticker. I don't know if these are genuine or not.
The antenna I have for my UV-3R is about 21 CM long, was advertised as an NA-775S, but the sticker simply says NA-775.
It's a keeper. The UV-3R is noticeably better on all frequencies, and the antenna is compact and flexible. I'm glad I bought it. Just be careful.

Topic: 4237 Message: 4237

Hi group!

Let me tell you about the latest adventure in UV-5R ownership...

After a few days of random on/off usage, without a stint in the charging cradle, and using TDR, or a combination of TDR and Scan I have been able to get some fairly weird results.

1. When using TDR ON and with TDR-AB set to A or B the A/B button will stop working. You will only be able to change the channel on which ever bank you have set in Menu 34 (A/B). You will have to set menu 34 OFF to be able to change the channels on the second bank again.
2. If you have TDR ON and set A or B to scan, it works for a while, but then something strange happens. I start receiving all radio traffic on the other bank. This is hard to explain, but .. Set a channel in A. Then scan on B. Use the A/B to go back to B and hit exit to stop scanning. So now you have a channel on A and a channel on B in regular TDR operation. TDR is set to ON (Menu 34 doesn't seem to matter). Multiple channel traffic all comes through on bank A. For instance, I have some police and sheriff freqs programmed. Suddenly they are all coming through the same bank and stepping on each other, like the radio is actually running as a dual receiver. Turning the radio off and pulling the battery for a bit seems to reset the issue and the radio returns to normal operation.

Both issues may be related to the scan function, more testing is needed.

This is a common misunderstanding on the UV-5R. Menu 25 and Menu 26 only have an effect in VFO (frequency) mode. Menu 25 and Menu 26 have no bearing on programmed channels.

Regarding 1- This is normal behavior. When TDR is ON and you set Menu 34 to A, then A is the 'focus'. Tx is locked to A and channel change is locked to A. You will hear traffic on B. Also the A/B switch is disabled.
Regarding 2- I cannot duplicate your problem. On my radio pressing ANY key stops scan- no Exit press is required.

Every UV-5R I've played with (4 so far) have the a VHF front end oscillation that causes the squelch action you are describing. See my technical paper in the files section for the fix.

The UV-5R is just an OK radio for $50. I have sold mine and moved on to other radios. If you can afford the Wouxun, that seems to be the better choice. The Japanese ones are even better.

Dan,

I agree with most of what you have said. If anyone buying the Baofeng UV-5R is expecting it to be as good as an Icom of Kenwood HT, they will most likely be disappointed.

I also think it is good to compare the differences between the different brands and models of these radios. Some of us are hams, some of us aren't. Some of us have Land Mobile requirements, some of us don't. Knowing the differences helps us all choose the best unit for our needs and budget.

My Baofeng UV-5R was $55 delivered to my door. When I ordered it, I never expected it to rival my Icom and Kenwood HTs (they cost cost up to 7 times more than the UV-5R). In many ways, though, my $55 HT exceeded my expectations.

There are some things I can do with the UV-5R that I can't do with either of my other HTs. For one, without any modifications, I can legally use my company's repeater and talkaround frequencies. My other HTs would require modifications before they could TX of those frequencies and then to do so would be contrary to FCC regulations.

It is also no secret that the UV-5R has many bugs. They are openly discussed in this group. For example the squelch issue you mentioned. Back on March 23 of this year, Steve - WB8GRS in message 550, did a nice job of reporting the squelch, receiver sensitivity and power output of the UV-5R. This report clearly shows that back then the squelch for VHF was broken. Unless it was fixed in a later firmware, its probably still broken. But remember, this is a sub-$50 HT (I figure it costs at least $5 to ship. Shipping isn't really free--it was just included in the price).

Hopefully the folks at Baofeng are monitoring this group and will be using the feedback to fix bugs and improve the features and useability of the UV-5R in later shipments. Should it end up being as good as an Icom or Kenwood? I don't think so (at least not at it's $50 price point). But if you are getting ready to buy one, and that's what you are expecting, then I agree with Dan and suggest that you look elsewhere. You won't be happy.

4243. Re: Chirp 0706 version: +/- OFFSETS not setting?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-11 00:00:20 UTC
From: Jim
Topic: 4223 Message: 4243

John,

The UV-5R in MR (channel mode) doesn't have a concept for +/- or offset. It just understands the programmed RX frequency and the TX frequency.

When you are programming the HT with the Baofeng software, there is not even a place to enter an offset. When you enter an RX frequency, the TX frequency is automatically populated with the RX frequency. If you want an offset, then you have to do the math yourself and enter the TX frequency.

When programming with CHIRP, you can select + or - and enter the offset amount (as most hams are used to). Then CHIRP uses the + or - and the offset to do the math internally and only sends the RX frequency and TX frequency to the HT.

The on the HT, when you select a channel with an 'offset', both the [+] and [-] symbols appear to let you know the RX and TX frequencies are different. Remember, the HT in MR (channel mode) has no concept of +/- or offset. It only knows the programmed RX and TX frequencies and if they are the same or different. Plus, the RX and TX frequencies don't have to be a standard offset or they don't even have to be in the same band!

When the [+-] symbol is being displayed, you can briefly press the [*/SCAN] key on the keypad and the RX/TX frequencies will be reversed. An [R] will now be displayed to the right of the [+-] and the TX frequency will be shown in the active display (assuming that the active display is set to display frequencies). Briefly press the [*/SCAN] button again to return the display back to the RX frequency.

So is what you are experiencing really a bug in CHIRP, or is this just a misunderstanding of how the UV-5R works?

Jim KC9HI

>
> Thanks to your help here, got the cable and Chirp loaded; issue I'm having is that despite going into EDIT, and setting the OFFSET (+/-) it is making all my channels simplex and not allowing me to save the repeater offsets. Is this a bug in the 0706 version or am I not doing something correct? I assume you input the receive frequency, the offset frequency and the + / - offset. It's the +/- positive/negative repeater offset that I can't get to save to the radio. It shows +- only for all channels.

Jim,
Good points. It's good for what it is. Toss it in the tackle box, the glove box, or the checked luggage and not worry about it. And, conversely it may see more use than more expensive radios for this very reason. It seems like it's not too far from being a much better rig. If the Baofeng folks are following this group they could certainly produce a better radio.

I've thought about some kind of workshop fix for the squelch issue (I'll check Dave's file for the technical notes and fix) that involves a clip of some kind to hold down the monitor button. A few minutes of holding down that orange button and I have, "MONI" imprinted on my thumb.

Date: 2012-07-11 01:15:55 UTC
From: tenorman1952
Topic: 4249 Message: 4249

Is there a way to completely disable the "Emergency Alarm" so it does not sound audibly nor will it transmit?

Can the manufacturer be persuaded to provide a way to do this?

73,
Paul - AE5JU

Paul,
Question 1
Yes, it can be disabled in the Optional Features menu of the Baofeng software.

Question 2
Yes, see question 1

I wasn't aware there were counterfeits out there, but mine is the real deal. I specifically wanted a more compact antenna similar to the OEM Wouxun antennas. Mine is 21.1 cm.

I have both, but for different radios, so it's hard to tell exactly. The size and flexibility are certainly very similar. But if I were buying one again, I'd opt for the NA-775S. I was more impressed with the performance difference it made to its radio over the stock antenna.Ian

Jim,

I marvel at your quick accurate answers ! I have most of this LCR figured out except for BDR. In the Baofeng software there is a box in the lower RH corner of the Options one could check for BDR and to the right is another option in the form of a dropdown menu. It reads, Transmit under BDR Star and then you select Off/A band/B band..... I would guess that if you checked the BDR box then you would have to make a selection under the BDR star ??

But why, what?

It would be best if you put your radio in your checked-in luggage. Just bring with you a copy of your ham license. I had the small copy, that comes with the license, laminated and always carry it with me like my DMV license. Safe trip !!!

John,

I always wondered what this was, too. So after I read your message this morning, I decided to figure it out before I went to work.

BDR = Dual Watch / Dual Reception - Menu 7 [TDR]

Transmit under BDR Star = Transmit selection while in dual watch / reception - Menu 34 [TX-AB]

Who would have though BDR=TDR? Anyway, mystery solved.

My UV-5R arrived about an hour ago. (I ordered it yesterday from Sinotel.co.uk) It's switched off and charging at the moment, with the cradle red light on, but I've noticed that, if I lift the HT out of the cradle, the light goes green, and stays green even when I replace it.

I have to switch off at the mains to get the red light back on. Is this what I should expect?

I recently traveled with a KX3 in a camera bag through Europe and Africa. The only place I had any trouble at all was Addis Ababa (Ethiopia). They had no idea what a telegraph key or Amateur Radio was all about. I think they finally found an official who knew something and they decided it was OK.

From my research, radios, computers, and the like are NOT supposed to go in checked baggage. Having said that, I sent a couple of radios, in original boxes, to Tanzania without difficulty. I think the problems arise from the level of knowledge, or lack thereof, possessed by the TSA agent.

I also recommend carrying the radio and license, as recommended by NK8J.

Don’t even think about putting your radio in checked luggage, or its charger.? It will disappear.
I’ve taken radios many places in my carry on and the TSA has never pulled the bag.? All of my chargers and electronics go in my carry on – cell phone, radio, ipad, etc.

Hi,

I have flown a few times now around the USA now with the Radio in my back pack and and not once has it been questioned.

That's how mine works. I just unplug the charger when I'm done charging.
Then when I need it, I plug it back in, drop down the radio and it's red
until it's charged.
I haven't checked if mine charges when the light acts funny. Doing it so
the lights are right make me feel better psychologically.

If you want to have fun. Check a gun (a starter gun will work) if you're staying in the states. I read an article a while back where a professional photographer packs one with his thousand dollar plus lenses. You're there when they check everything and it gets locked up and can't be opened before the destination.

Becky,
If you are just flying inside the USA, it is no big deal.
I have taken a variety of HT's with me on the plane and have not had a problem.
Sometimes I'll pull it out of my carry on bag and place it separately in the
tray, but even that is not necessary.

If you are traveling internationally, it might be a different matter.

4279. Question about scanning

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-11 14:39:24 UTC
From: dawnfelicidario
Topic: 4279 Message: 4279

Hey Guys,

I have my radio set on dual watch with band "A" set on my EMS frequency and band "B" scanning. The question I have is that when scanning and the radio lands on a frequency with traffic the audio cuts out periodically. About every 5-10 seconds the audio cuts out for a second or two. Is there any way to keep it from cutting the audio like this? I have the Save menu turned off so its not that. Im not sure whats going on but sometimes I miss some dispatch information.

The only thing I wish the radio could do is be able to set band "A" on my EMS frequency and set band "B" to scan and set the TDR Menu 34 to default to band "A" For transmitting while "B" still scans. The radio doesn't seem to allow you to scan and have the menu 34 set to transmit on the other band.

Any thoughts? Maybe one of the CHIRP Guru's can help us out with that.

Thanks
Stephen

4280. No Tx Audio

Hmm, lets at least get issues filed to close that gap, okay? If there
are things that will be very difficult to support in CHIRP for some
reason, then that's fine, but lets not leave anything unimplemented that
folks actually want to use.. :)

I have flown a few times recently with a portable ham radio in my carry-on bag. (I prefer not to pack it in my checked bag.)

I put my radios into round, plastic containers that antibacterial hand and face wipes come in. (Sorry for the bad sentence structure.)

TSA has never blinked when my carry-on bag has gone through their X-ray devices. I have never been asked for my F.C.C. license, even though I always carry it with me, just in case.

Probably not your issue, but one oddity that I discovered with these radios is that an external mic doesn't pick up any audio if you use the radio's PTT button. You have to use the external PTT with an external mic.

Jack,
If you search the group you will see that others have had this issue. There is a contact (or more) that get opened when a plug is inserted in the radio. Sometimes debris from the manufacturing process gets into these contacts and keep it from closing after the plug is removed. Some have been successful in restoring their TX audio by insert and removing the plug from the jack and squirting some compressed air in the jack holes as well.

Another thing that is a possibility is that the mic hole in the radio is closed off in the inside of the case. I just noticed that a paperclip just fits in the mic hole. Gently inserting a paperclip into my mic hole until is stops and marking it, I see it goes about 7/32" into the case. That roughly .22" or 5.6MM. If you would do the same and it stops way short of that, then I say the mic hole is not through.

Topic: 4268 Message: 4289

Could be the battery was already fully charged. If I put a charged battery in the charger, sometimes the LED will glow red. Then if I lift (or wiggle) the battery the LED will turn green and even stay green when the battery is immediately put back in the charger.

Also when there is no battery in the charger, the LED should glow a solid green with a pulsing red. It could be possible that you didn't notice the pulsing red.

How do I toggle between high and low power?
Tried pushing the lock/# key but that does not work.

Thanks,
Jack

Many of us have the same problem. Some have drilled out the mic hole on the radio. I chose to use an external mic. I picked up a low cost speaker mic from Powerwerx for the Wouxon radio. Totally compatible.

Jack,

Is Menu 7 [TDR] (aka Dual Watch) set to ON? I believe that I mentioned a few days ago that the #/LOCK toggle for high/low power does not function when Dual Watch is enabled.

Set TDR to OFF and try it. If that was it, then you will have to decide which is more important to you. Also note that the high/low power toggle is only temporary. Once you leave that channel, the power will revert back to the programmed setting when you return to that channel again.

Gary,
Menu #2 only set the power level when if VFO (frequency) mode or to the value you want programmed when programming in MR (channel) mode. Once the channel is programmed, and you are in channel mode, Menu #2 has no affect.

I thought TXP was across the board but I see now it isn't. I never set handhelds to any thing but high. Well almost never, I did set the MURS frequencies to Low to be compliant power wise.

Subject: [baofeng_uv5r] Question about scanning

Hey Guys,

I have my radio set on dual watch with band "A" set on my EMS frequency and band "B" scanning. The question I have is that when scanning and the radio lands on a frequency with traffic the audio cuts out periodically. About every 5-10 seconds the audio cuts out for a second or two. Is there any way to keep it from cutting the audio like this? I have the Save menu turned off so its not that. Im not sure whats going on but sometimes I miss some dispatch information.

The only thing I wish the radio could do is be able to set band "A" on my EMS frequency and set band "B" to scan and set the TDR Menu 34 to default to band "A" For transmitting while "B" still scans. The radio doesn't seem to allow you to scan and have the menu 34 set to transmit on the other band.

Any thoughts? Maybe one of the CHIRP Guru's can help us out with that.

Thanks
Stephen

Look carefully at the spring contacts on the charger.

On my charger, about the 6th time I inserted the radio, the flimsy spring contacts bent downward so one would not make contact.

The charger light went red and stayed red, but the radio never charged.

I must be dense. Un-checking the "ALARM" box under "OPTIONAL FEATURES" just seems to silence the audio thru the speaker but the radio still transmits the alarm. By changing the selection from "SITE" to "CODE," the radio will transmit the alarm for 5 seconds then change from a cycling tone to a morse code phrase, then it will stop. Changing the selection to "TONE," sounds a steady tone but the radio still transmits (forever) the cycling tone.

What am I missing?

Jeff,
I'm the dense one. I looked at the software and saw the tick box for the alarm and just assumed that it would disable the alarm if it was unticked. I didn't test it.

You are not missing anything. Now that I've done a little testing, it appears to me that ticking or unticking the alarm makes no difference. No that's embarrassing.

I guess our best bet right now is to set the alarm to SITE. At least the alarm doesn't go out over-the-air.

The question then would be, is the UV-5R firmware broken or is it the Baofeng software? If its the software, then maybe Dan Smith and his team could add an Alarm Disable feature to CHIRP.

Sorry for leading you on a wild goose chase.

Hi Jim,

No worries. Now we (and perhaps the programmers) know what can be fixed
next time around.

Jeff,
I'm the dense one. I looked at the software and saw the tick box for the alarm and just assumed that it would disable the alarm if it was unticked. I didn't test it.

You are not missing anything. Now that I've done a little testing, it appears to me that ticking or unticking the alarm makes no difference. No that's embarrassing.

I guess our best bet right now is to set the alarm to SITE. At least the alarm doesn't go out over-the-air.

The question then would be, is the UV-5R firmware broken or is it the Baofeng software? If its the software, then maybe Dan Smith and his team could add an Alarm Disable feature to CHIRP.

Sorry for leading you on a wild goose chase.
Jim KC9HI

--- In baofeng_uv5r@yahoogroups.com, "j5wv280" <felix1063@...> wrote:
>
>
> I must be dense. Un-checking the "ALARM"
box under "OPTIONAL FEATURES" just seems to silence the audio thru the speaker but the radio still transmits the alarm. By changing the selection from "SITE" to "CODE," the radio will transmit the alarm for 5 seconds then change from a cycling tone to a morse code phrase, then it will stop. Changing the selection to "TONE," sounds a steady tone but the radio still transmits (forever) the cycling tone.

I programmed channel 0 in the baofeng software. When reading the radio back in CHIRP (last daily build) channel 0 uploads with ??? for values. the line for Channel 0 is also grayed out.
So it appears that I am totally incompetent at using CHIRP or that CHIRP is challenged reading read Channel 0.

Hi there!

The same think when I programmed the first two memories with the keyboard in a Puxing PX-777, my solution was only program the radio with Chirp and no more problem.

I've had channel 0 programmed in my HT from day 1. It is the NOAA weather channel for my area, 162.450MHz. I've also been using CHIRP since it started providing UV-5R support. I have never seen this on any channel. My OS is Windows 7 Home 64-bit.

I've been running CHIRP Daily 20120630, but this morning I upgraded it to 20120706 to see if something in this newer version affected this. Channel 0 still downloads fine for me.

It looks like CHIRP has a new feature where you can set the upper and lower VHF and UHF band limits (It is on the Settings | Other Settings tab. Just a wild guess, could the frequency of your channel 0 be outside of the default range?

You may have to give us more details about how your channel 0 is programmed.

I discovered this feature last night. I set the Region 1 UHF frequency band (430 to 440 MHz) and run the scanner - it scanned from 430.000 to 441.000 so I had to adjust the settings to 430-439. The same with the VHF band. Is that correct, or am I doing something wrong here?

Hello everyone
I have just received and installed the control software.
The first thing is i have question marks everywhere.
The second one : there is no more recent software for this radio because it seems very old.
I thought it was possible to have alphanumeric memories
My english is not very good so i might have missed something
Cheers from France
Alan

Download the 'VIP' version from the Files section- maybe this link will work-
http://f1.grp.yahoofs.com/v1/QLz-TxdGnBdK3bJDwNbdLY0jzW17c5GCfav_VtSnKXGtazvFVzlNVqaQYcFYfk1yE-kWQsxH_etlGGPbbjLBfCvurngf2Yk_Qvw/BF5R_VIP_CPS.rar
When you run the program, move the mouse to the 6th '??' and click on it- then select English. The Com Port defaults to COM 1 so you have to select the correct com port each time you run the software.

It depends on the design. As I wrote in another post, dual-band antennas are a compromise by definition. Mono band antennas *can* be more efficient, but when they are, they're often too long to be of any practical use on a hand held.

A full-length 1/4 wave antenna for 2 meters for example would be almost 50cm long. Something like that would really look 'out of place' on such a small HT.

In theory, the gain of such an antenna would be exactly 0 (zero) dBd. Helical antennas, like the one Baofeng delivers with the UV-5R, deliver a negative gain of somewhere in the range of -3dBd to -6dBd, depending on the operating frequency, length and construction. They're much more practical however, and that's why we love to use them.

```

If this makes sense to you then you will have to use a TEXT editor like Notepad to read it. I'm not sure at this point what you would change as I have not studied the Baofeng files. To make this work easy with Notepad you may Rename the .DAT to .TXT and then back again before using it on your unit. Be sure to save the original file before you mess around with this.

You might be better off using Chirp as you are able to download to a spreadsheet file.

Good Luck !

John

I would like the back light LED to come on only when i press a button on my UV-5R radio.

I thought that's what menu 29 was suppose to do, but have noticed the backlight led comes on at the end of the squelch, whether a repeater or simplex operation every time atthe tail end of the rx audio on this radio.

This will eventually drain the battery quickly if I am listening to an active frequency.

I have disabled(OFF) both RX and TX LED's under menu's 30, and 31

Help!!!

When I press the VFO button it displays a VHF & UHF frequency. I believe this is the same as what shows in the A & B boxes in the software. How does this relate to anything other than one is VHF and the other is UHF? I'm guessing I could put VHF frequencies in both or UHF in both and still be able to program the radio with out a problem. Are they just to show the radio can do both VHF & UHF or is their another reason I'm missing?

You can program default VFO frequencies.

i know i can disable it completely...even from the key pad.that's what menu 29 does, when OFF is selected.

I would like the back light LED to come on only when i press a button on my UV-5R radio.

understood.

I would like to be able to have the LED light up, when i start pressing buttons, in the dark. I don't need the LED to come on every time someone talks on the radio.

I guess I am asking for this radio to perform like any other amateur radio ie yaesu, or icom/kenwood, BUT i guess it won't because it's a $50 radio.

Jimmy asked about the LEDs turning "on" when pressing buttons:

> I would like to be able to have the LED light up, when i start pressing
> buttons, in the dark. I don't need the LED to come on every time
> someone talks on the radio.

I *think* what you are saying is that the LED *does* come on when you push buttons, but it *also* comes on after someone transmits, and you don't want it to do that second thing. My radio does both of those things. I have Menu 29 set to purple.

I am happy that it comes on when I push buttons and I don't care if the LED comes on after someone transmits.

But then, my usage may be completely different from your usage. Perhaps this is something that can be adjusted in the future.

From: Jim
Topic: 4329 Message: 4338

Gary,

When in VFO (frequency) mode, the A (upper) and B (lower) displays are like having two "scratch pad" channels. Either display can be toggled between VHF and UHF with the BAND key. [The default for each display can be set with the Baofeng software. They can be the same or different. However you want it.]

You can scan either dispaly at the current STEP to search for active frequencies within the band limits. [I believe the new CHIRP daily now allows you to set the band limits.]

You can enter a frequency, power level, shift, offset, ctcss tone, etc. (anything that you would normally do to manually program a channel) and quickly get on-the-air on two different frequencies all without having to commit either one to a channel. Then you can quickly toggle between them with the A/B key.

A word of caution. I believe the HT will be capable of transmitting on the frequency shown (or shifted to) in the active display. Avoid pressing the PTT (or alarm button) if you are not licensed for that frequency.

I hope that helps.

Jim KC9HI

I wish Yahoo would let you edit you posts :(

I tried to change the power on banner, and it completely disappeared. I am using the latest build of Chirp from 6 July 2012. I tried to set it back to the defaults but no joy in that. The radios work - just no power on banner. Has anyone else encountered this? Is there a fix for it?

Here's what I do...

Google "chirp programming"

Click the link "Home - CHIRP"

Click the "Download" tab

Scroll down to the bottom of the page.

In the section where it says "Development builds" you'll see a sub-section titled "Windows, MacOS, Linux". In that sub-section look for the sentence that says "Click here to find the latest version." and then click the word 'here'.

Scroll down to the bottom of the page (the newest are at the bottom) and then click on the bottom most "daily-yymmdd/" folder (yyyy=year, mm=month, dd=day).

Download the correct file for you OS

I don't know if anyone is interested, but there is now a new extremely high-capacity 3600 maH lithium battery for the Baofeng UV-5R. It's quite large! But it only costs $26 (no shipping charge). I have a blue UV-5R, so naturally I ordered the blue high-cap battery. Here are the details from my eBay transaction:

Hey, have any of you ever heard of anyone having trouble getting their USB programming cable drivers installed and working properly? No? I know, I know, it's pretty rare.

Well in the off chance that one of you does hear of someone with a "This Device cannot start (Code 10)" or "No driver installed for this device" or "Device driver was not successfully installed", send them to

http://www.ifamilysoftware.com/news37.html

so they can read the "Family Software Newsletter #37". This newsletter provides a simple 8-step guide, that when followed should result with "Your device is ready for use". The guide also links to a download containing not only the correct driver to be installed, but also a program from Prolific that will uninstall and completely remove the 'bad' driver so the 'good' driver can be successfully installed.

Hi All,

I've had my 5R going on 3 months now, program mostly with the Baofeng software but work with Chirp also. Today for the first time I noticed that my computer's USB slots are not all the same !!

I was not paying attention and plugged into a slot that usually has my backup drive in it instead of the one that I used to set up the Baofeng software with and have used every other time.......... the software could not find my cable/radio/port until I plugged into the other port.

I am running Win 7/64........... thought I would pass that along.

I programed my radio like they showed in youtube video at:
http://www.youtube.com/watch?v=X6Ze-0C9qJs
Well, after doing this over and over... I get to listen to fire, police and ham ONLY if I press the MONI button. I tried to open the squilch in any possible numbre from zero to 9...nothing happened. I know when I recieve a call from friends when the light on my UV5 turns on... then I press the MONI buttom and I can listen to them.
Some dude told me about that I need to program the tone... so I can listen to a police and fire and ham....
How do I resolve this problem? my other radios work just fine... but this one I just cannot make it work right.
Could you guys help me please?
THank you in advance...
PS: After I programed the radio like in the video on youtube above... some how the setting changed by themseves ... I just dont get it.. I am new to these problems.. I just got my ham license a few months ago.
Thanks again...HELP ME PLEASE guys... I want to enjoy my radio !!!!!

If a USB cable or USB to Serial converter is plugged into a different USB plug than the one normally used the Serial port number will change in Windows (no matter what version of Windows you are using). This is a normal thing.

Hi All,

I've had my 5R going on 3 months now, program mostly with the Baofeng software but work with Chirp also. Today for the first time I noticed that my computer's USB slots are not all the same !!

I was not paying attention and plugged into a slot that usually has my backup drive in it instead of the one that I used to set up the Baofeng software with and have used every other time.......... the software could not find my cable/radio/port until I plugged into the other port.

I am running Win 7/64.......... thought I would pass that along.

Hey, have any of you ever heard of anyone having trouble getting their USB programming cable drivers installed and working properly? No? I know, I know, it's pretty rare.

Well in the off chance that one of you does hear of someone with a "This Device cannot start (Code 10)" or "No driver installed for this device" or

"Device driver was not successfully installed", send them to

http://www.ifamilysoftware.com/news37.html

so they can read the "Family Software Newsletter #37". This newsletter provides a simple 8-step guide, that when followed should result with "Your device is ready for use". The guide also links to a download containing not only the correct driver to be installed, but also a program from Prolific that will uninstall and completely remove the 'bad' driver so the 'good' driver can be successfully installed.

Make sure you have ctcss and/or dsc squelch turned off. Ctcss is tone squelch. Only use it when you know the other station is transmitting a tone.

You have some how turned 1 or both of those on.

Tony,

Thank you for that information, my point was to bring this to the attention of the group as it is another point to consider when you are having problems.

Most USB devices do not care which of the several ports you use, they all work. This cable is from a different form of USB than most are used to using and it's not common knowledge from a user standpoint.

I recently acquired a Baofeng UV-5R VHF/UHF Transceiver. I am quite happy with its performance, except for a minor problem. I can assign and store VHF frequencies in empty memory channels, but I am unable to do likewise for UHF frequencies. Resetting the VHF/UHF menu item does not solve this problem. I seek the help of knowledgeable users of this rig.

Yeah, well, I've got good news and bad news. The good news is that you can fix the problem by going to menu items 10 and 11 (two flavors of receive tones), and setting them both to OFF.
The bad news is that this will not affect the channels you have already programmed into memory locations. They have stored the receive tone that was active at the time. You will have to delete the memory location with menu item 28, set the tones OFF, and program your channel again via menu 27.
If you have a program cable and are using either of the computer software offerings to program the radio, that's dead easy.

Mike (Canada),

The original poster stated "I'm flying and want to bring my radio with me. Will be checking bags. Will the TSA give me grief about it? Has anyone flown with their radios? any tips? Peace, Becky (Chicago, IL)"

This tells me that "Becky" will be boarding a plane from Chicago, Illinois AND wants to know if TSA will give her grief?

Actually given the opportunity... TSA will not give, but "MAY" TAKE Becky's belongings...

This 1st one took place in CHICAGO JFK airport last Sept 2011.

I'm going to make an assumption about what you're doing. I could be way off, so forgive me in that case.
Unlike some radios, the upper and lower displays are both fully functional (almost--just wait) in either band. They are NOT a VHF VFO and a UHF VFO. You can have VHF in A and/or B, or UHF in A and/or B,... whatever you want.
Now the pitfall, in which you have much good company. The memory locations can only be programmed from VFO A.
So if you've been using the bottom display for UHF out of aesthetic convenience and trying to program from there, that's been your problem!

TSA theft. Which is why I suggested bringing a gun (Even just a starter pistol).

http://www.tsa.gov/travelers/airtravel/assistant/editorial_1666.shtm

You need a proper case, and must declare it. Looks like a flare gun works here too. Main point is, its then locked. If you declare it, its marked as such and they must leave it locked. Nothing states you cannot put other things into an approved case.

I heard that it really makes it a massive hand-held radio. Someone on another group mentioned that his large battery rattled when shook; did you have similar circumstances with yours?

Most keyboard programming guides have you skip over Menus 10, 11, 12 & 13 when programming a channel that doesn't get tone coded squelch digital coded squelch. This is not correct because if you just got through programming a channel that used tone/digital coded squelch, those settings would be remembered and wind up being programmed into your new channel that didn't need them. Buddy's "baofeng-uv5r-eyes-free.rtf" guide (available in the files area) is about that only guide that I know that tells you for programming channel that don't need coded squelch to check the menus 10, 11, 12 & 13 to make sure they are set to 000 or OFF. Thanks for doing it right Buddy.

When it channel mode, look to the left of the currently active channel. It will show a CT or DCS if there is a receive tone coded squelch or digital coded squelch programmed for receive. Now press the PTT and look in the same place to see if coded squelch is programmed for transmit.

If tone and/or digital coded squelch is being used and it shouldn't be, the channel will have to be deleted and then reprogrammed to change it via the keypad. It is much easier to check and/or change using the Baofeng or CHIRP programming software.

Hello, all guys.
This is the Chinese largest online retailers nicheone store, I promise and guarantee that all of the UV-5R radios we are selling are original manufacturer's latest firmware version. As the low price because we want to provide cost-effective product and let every customer can get the radio who interested it.

From: toledohamradio
Topic: 4359 Message: 4373

I made a call to my 94 VHF repeater and it seems like all I can do is 'kerchunk' the repeater despite making a 15 second transmission.

I have the CTCSS PL transmit tone turned on, and value set, but even keying the radio and holding it down, the repeater acts like I only sent a 1 second transmission. Is the PL tone not 'strong enough' to hold the repeater? DCS is off, PL receive is off, just the PL transmit is loaded, so I don't know why the repeater is 'leaving me out'?

And what's with the microphone deal - do you need to ream out the hole?

So, is it that you can't tune UHF frequencies at all, or that they won't store?

If it's that UHF isn't storing, be sure that you're programming them from theA display. You can program nothing from the B display.

You may be holding the button down too long. Just a momentary press will give you FM receive. Hold it down longer and the alarm sounds.

I believe that we have established that it is not possible to completely defeat the alarm function.

Capt Miller posted:

> Some dude told me about that I need to program the tone...

"Some dude" was wrong. It is NOT necessary to program the tone to receive public safety.

You should pick ONE channel to work with. DELETE that channel. Menu 28.

Then go back to VFO, program the frequency only, do not program R-DCS, do not program R-CTCS, do not program T-DCS, do not program T-CTCS. All should be OFF.

STORE that channel. Menu 27.

If you do that, then you should be able to receive that frequency. If it works, you can follow the same procedure for other public safety channels.

FOR HAM RADIO, it is a slightly different story. You may have to store the repeater ctcss tone in T-CTCS IF that repeater uses tone.

Please report your results here.

I reamed out the hole on mine but don't think it did much good.
You just need to put your lips almost against the radio's mic hole,
otherwise you are going to have
very low audio on transmit.

its not getting any better the unit has to be reprogrammed every time you turn it off.

try to call baofeng or try to email it nothing but a joke!!!

4396. New Photos - Battery conversion

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-14 05:09:12 UTC
From: j5wv280
Topic: 4396 Message: 4396

Hello All,

I've enclosed some photos in the "photo" file of the internals of a Baofeng UV-5R battery. This project came about due to the weight differance between a Motorola XTS2500 battery which weighed 14 ounces and the UV-5R battery with the same capacity but weighs in at 4 ounces. The UV-5r battery in the XTS2500 radio on scan and transmit lasts a good 8+ hours. but weighs 10 ounces lighter which lessens the weight on my lower back.

In short, these in-expensive batteries can be converted for use in other devices where the voltage and capacity requirements are compatable.

Dear Ian,
You are right, the manual is neither exhaustive nor well-written. But when we get a feature-packed rig for a low price, these shortcomings can be overlooked. Hope this "Toy-rig" would give us all the pleasure of thousands of "Toy-metre" QSOs!
Jayaram, VU2JN.

Has anyone else bought one of these radios (HL-UV8R)?
http://www.ahappydeal.com/product-82752.html
I had to buy 2 at that price (less than 42 bucks).
I am impressed with the quality of this little 7 watt rig.
BUT....the Chin-english manual is horrible!
I did managed to delete all the factory channels. But haven't figured out how to manually program it.
Worse yet, it accepts the standard Baofeng/Wouxun/Kenwood programming cable, but I can't find software that will read/write to it. The cable has to be the same (I assume?) as a speaker/mic works well with it.
Thanks for any help.
Ray.

Interesting. 42 bucks for 7 Watts,... sounds like a good little candidate for permanent residence beside the spare tire in all the family vehicles.
I like the response on the website to the question about computer programming, "
Walkie Talkie can not be programmed with a computer and is there software to do this with. " Uhm, yeah.
Sounds like you're our Chuck Yeager on this little radio Ray. Keep us posted!Ian

Try docs and software for the TYT 800 or 'FM transceiver 706', because that's what it looks like.

The 7 Watt is more likely input power, not output power. Assuming an 50% - 60% efficiency, you'll probably end up with 3.5 - 4 Watts output.

TYT website:

http://www.tyt888.com/en/Download/Detail.asp?id=359&typeid=22

I followed the link to the TYT website - take a look at their TH-F8 - it bears more than a passing resemblance to the UV-5R. (sans flashlight, and only single band) It does have one useful feature acording to the spec - it has a STUN mode! "(Remote skill/stun/activate(optional))" How did THAT get past the FCC!?

The resemblance of the UV-5R with the TYT TH-F8 was common knowledge from the beginning. Chances are that the same manufacturer produces both, or at least the case they're put in.

The remote kill/stun/activate function is becoming more and more popular. No idea about FCC regulations, but here in NL the authorities couldn't care less.

Actually, here you can import, buy and own anything, even without a licence. You must, of course, limit usage to the restrictions which come with your particular licence. This wasn't always the case. Sometimes less strict regulations aren't equal to progress. Now jammers (mostly pirate stations) overflow repeaters, and they're never tracked down, let alone caught.

One miserable signal on the FM or MW band though and you're in deep sh** faster than you blink your eyes. The initial fine is 2245 up to 4500 euros, and will rise to 45.000 euros if you're caught a few times in a row.

You have to send it back to the vendor you bought it from, not Baofeng itself. AFAK, Baofeng doesn't sell them to end users, but use a dealer network instead.

Most vendors I know, all of them active on eBay, go to great lengths to make you happy.

Different ads, I've noticed 99 channels, 199 channels, and 120 channels.
One of the ads out there said it was dual band dual display, but the pics
only show one frequency. Well, some of them. Others look like the Baofeng
5r.
I'm completely confused, but intrigued as well. Let us know what's what.
The price is right.

Oh, is it available in two models?
Frequency range has two blocks of info seperated by a line

136-174, 200-260, 400-470, 470-520

Now more confused.

Topic: 4399 Message: 4414

I started a new Yahoo Group called UV8R.

I can see where the two transceivers in one group might cause some confusion. If you have a UV8R, you might find the answers over there.

Maybe the topic starter can tell us whether it is dual band or single band. If I understood well, he bought 2 of them.

I suspect it is a single band trx, just like the infamous TYT-800. If so, it's a waste of money.

4416. "Radio did not respond"

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-14 16:18:19 UTC
From: dlben24
Topic: 4416 Message: 4416

OK! I have had the uv-5r for a few days now. When I first got it I used CHIRP and put a couple repeaters in the radio. Worked fine. This morning decided to complete the programming and when reading from radio I get "Radio did not respond". Tried different radio settings ie: vfo/mr, a/b, on/off. Cable plugged all the way in. Change usb ports. Anything better? Thanks for any help.

4418. Re: "Radio did not respond"

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: Jim
Topic: 4416 Message: 4418

If you plugged the cable into a different USB port than was used previously, windows will assign different COM port. You will have to determine the new COM port number and change CHIRP to the port number. Use FindComPort.exe from uv-5r.com or just use Device Manager to find the COM port number.

If that isn't the problem, then I might suspect a cable problem.

Topic: 4420 Message: 4420

I got one of the 4-005+44-K :D-Ring Ear Hanger Boom Mic ,Ear hook with Mini Boom at the same time I ordered my UV5-R.
It seems to work ok except on VOX. When I set the PTT/VOX switch to VOX the radio is keyed all the time, no matter what
the setting of the VOX menu #4 on the radio. Has anyone else had this problem? I have just emailed shop409 where I purchased
this equipment to see what they say about this?
Thanks in advance for any help.

Have you checked in the device manager to see if your system is still happy
with the driver? Perhaps your system updated it behind your back.

Topic: 4416 Message: 4424

Someone back in May talked about taking a thought to be defective cable apart and reported that the build quality wasn't anything to write home about. A picture was uploaded, "USB cable end.jpg", and is in the files area.

These cables sell cheap and it is obvious they have a build quality that is consistent with the price. Because of this, I'm not sure is such a thing as a "known source for a better quality cable".

I've purchased 2 cables from 2 sources and so far they have worked fine for me. The cable that I use every day was purchased on eBay from mega409shop (a www.409shop.com affiliate). My backup cable came from www.dealextreme.com. It was packed in a small cardboard box that is nice for storing it away in.

Instead of me repeating it here, just search the group with '6-034' and you will see posts from me with more detail about the sources and the prices of these cables.

4425. Programming using a RIB

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-14 18:22:34 UTC
From: wb9vxy@sbcglobal.net
Topic: 4425 Message: 4425

Has anyone looked to see if the old Motorola RIB has the right
levels so it could be used for programming this radio to avoid
all the hassles with the USB cable?

By the way, the first times I tried with the factory software
and Chirp it worked. Then if failed on both. I gave up
for the night and the next morning Chirp worked with only
a minor hicup or two.

Now only using Linux and Chirp.

4429. Manual Keypad Programming of the Baofeng UV-5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-14 19:36:50 UTC
From: Will Sperling
Topic: 4429 Message: 4429

I have previously uploaded this message to the "files" section of this Yahoogroup, but figured I'd post it here for those who do NOT wish to use Baofeng or Chirp software. This process was written by a fellow ham Murray W9EHQ who also chooses not to use the programming software.

I did not write nor use this process, so I cannot answer any questions or field issues on it. I only posted it for other hams who wish to manually program their UV-5R's via the keypad. 73 from K9WSS, Westmont, IL USA.

Turn on radio

With VFO/MR select "freq. mode"
With A/B, move cursor to upper display
With BAND select VHF or UHF (in this case VHF)
With NUMERIC KEYPAD enter desired RECEIVE freq. (in this case 145.430
)

Press MENU + 2 + MENU
With UP/DOWN ARROWS select HIGH or LOW POWER
Press MENU + EXIT (radio voice confirms selection)

Press MENU + 5 + MENU
With UP/DOWN ARROWS select WIDE
Press MENU + EXIT (radio voice confirms selection)

Press MENU + 1 + 3 + MENU
With UP/DOWN ARROWS select PL FREQ. (in this case, 107.2)
Press MENU + EXIT (radio voice confirms selection)

Press MENU + 2 + 5 + MENU
With UP/DOWN ARROWS select OFSET DIRECTION (in this case -)
Press MENU + EXIT (radio voice confirms selection)

Press MENU + 2 + 6 + MENU
With NUMERIC KEYPAD enter OFSET FREQ (in this case 00.600)
Press MENU + EXIT (radio voice confirms selection)

Press MENU + 2 + 7 + MENU
With NUMERIC KEYPAD select memory channel location (in this case 50
)
Press MENU + EXIT (radio voice confirms RECEIVING memory channel)

With NUMERIC KEYPAD enter desired TRANSMIT freq. (in this case
144.830)
Press MENU + 2 + 7 + MENU + MENU + EXIT (radio voice confirms XMIT
freq)

Programming complete for this channel. Now to display what you have done ..

With VFO/MR select Channel mode in upper display
(1) Press A/B to move cursor to upper display
Press UP/DOWN ARROWS to select Channel # desired
(2) Press A/B to move cursor to lower display
Press UP/DOWN ARROWS to select same channel # as displayed in upper display
(this Chan. # will be the small # to the right of the Freq. display)
So when the Channel # (top display) and the channel # next to freq. (bottom display)
agree, you now know what freq is in that particular memory channel.
Note: items 1 & 2 above can be reversed if you forget what is in each memory channel but know the freq. you want.

Also note: Assuming your channel# (upper display) and corresponding freq. for that channel (lower display) match, with the cursor is next to the channel #, the freq. displayed on the bottom display will be the RECEIVE freq. ,even when you transmit. However, if the cursor is next to the bottom freq. display, and an offset freq. has been programmed, when you transmit, the TRANSMIT freq. will be displayed.

Good Luck de W9EHQ

Sometimes the headset cord picks up Tx RF that holds the key enabled. It can sometimes be fixed with a ferrite core on the headset cable near the radio connector.

This only works if TDR is off, or so I'm told. If in VFO mode, AKA frequency mode, menu #2 will change power levels.

Mouse click the 6th set of '??' and select English. Have to do this and select ComPort each time you start the program.

4441. tx inhibit set to all memories and will not clear

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-15 00:21:34 UTC
From: je1955tomcat
Topic: 4441 Message: 4441

I'm using the latest daily download. Radio firmware is BFB251.

The radio was originally programmed with the BF5R software. I downloaded CHIRP and read from the radio and made some additions. When I wrote the changes to the radio it enabled "tx inhibit" on every memory channel. When I clear the flag, it re-enables after leaving edit mode.

Any ideas?

Thanks for the help!

4447. Cranky about the connector!

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-15 04:14:43 UTC
From: J.Gordon Beattie, Jr., W2TTT
Topic: 4433 Message: 4447

I was programming my pair of UV-5R radios tonight and as I was doing incremental testing of the radios one of the radios stopped transmitting audio. At first I thought it was something in my programming, but I tried one of the speaker/microphone earpieces and the radio produced transmit audio! So now I get to do surgery on the radio to repair a flaky jack!

Boy, I can't wait!

I will hold off until tomorrow after I get some rest!

This is the same one that had the screw socket for the belt clip set too low and the screw wouldn't reach. I had fixed that previously with a dot of superglue.

All this fun in the last three weeks of ownership! I may email www.radishop888.com <http://www.radishop888.com/> and ask them for their suggestions, as I'm thinking that the one radio has issues!

BTW: It is a red UV-5R and in otherwise good shape and works just as well as the other one. I'm just getting a bit nervous about it because I have had two mechanical issues with the same radio.

In the meantime, I'll just keep reminding myself."It's only a cheap Chinese radio." a. k. a. "LCR" or "Little Chinese Radio"

Thanks & 73,

Gordon Beattie, W2TTT

Yeah, well, I've got good news and bad news. The good news is that you can fix the problem by going to menu items 10 and 11 (two flavors of receive tones), and setting them both to OFF.

The bad news is that this will not affect the channels you have already programmed into memory locations. They have stored the receive tone that was active at the time. You will have to delete the memory location with menu item 28, set the tones OFF, and program your channel again via menu 27.

If you have a program cable and are using either of the computer software offerings to program the radio, that's dead easy.

Capt Miller posted:

> Some dude told me about that I need to program the tone...

"Some dude" was wrong. It is NOT necessary to program the tone to receive public safety.

You should pick ONE channel to work with. DELETE that channel. Menu 28.

Then go back to VFO, program the frequency only, do not program R-DCS, do not program R-CTCS, do not program T-DCS, do not program T-CTCS. All should be OFF.

STORE that channel. Menu 27.

If you do that, then you should be able to receive that frequency. If it works, you can follow the same procedure for other public safety channels.

FOR HAM RADIO, it is a slightly different story. You may have to store the repeater ctcss tone in T-CTCS IF that repeater uses tone.

Please report your results here.

Gordon,
At least two individuals in the group have had this issue and were able to 'fix' it without 'surgery'. I believe repeated insertion/removal of a connector and/or blowing compressed air from a spray can of compressed air into the jacks were reported to do the trick. Apparently debris from manufacturing gets between the contacts and keeps them from making contact. So unless you are not being sarcastic and really 'can't wait' to open up your UV-5R, you might give this try.

I have had the Wouxum KG-UV2D for 1 year and the Baofeng UV-5R about 6 months. I can't give you any figures, but the Wouxum is a mush better radio. I haven't had any problems with either one. I just like the Wouxum better. BTW, I got the $3.79 antenna talked about here in the group. Very good, much better than the stock Baofeng antenna.

I own(ed) and tested about every interesting Chinese ht. The Wouxun is superior in most aspects, but not all.

I live in 'intermod alley'. The only Chinese ht's capable of handling strong out-of-band signals as they should, are the Wouxun KG-UVD1P and the Quansheng TG-UV2. The UV-5R has somewhat more trouble surviving my QTH.

Sensitivity: not much difference between the three.

Audio: Wouxun UVD1P #1, Quansheng #2, UV-5R #3.

Battery life: Quansheng #1, UV-5R #2, Wouxun #3.

Scanning is painfully slow on any Chinese HT, I think they still don't quite understand the concept. In my humble opinion scanning is generally usable in channel mode, but near-pointless in VFO mode.

Thanks for the replies. What I like about the Wouxun is the audio is louder than any of my Japanese HT's; plus the receive sensitivity seems to be a bit better for weaker signals.

What I don't like about the Wouxun is the way it scans. If the scan stops on an active frequency with an incorrect PL tone, instead of the scan continuing when it realizes the tone doesn't match, it just sits there, stopped on the channel, even though the audio is muted. Does the Baofeng behave in this same manner?

What I don't like about the Wouxun is the way it scans. If the scan stops
on an active frequency with an incorrect PL tone, instead of the scan
continuing when it realizes the tone doesn't match, it just sits there, stopped
on the channel, even though the audio is muted. Does the Baofeng behave
in this same manner?

Subject: [baofeng_uv5r] Re: Baofeng vs. Wouxun

I own(ed) and tested about every interesting Chinese ht. The Wouxun is
superior in most aspects, but not all.

I live in 'intermod alley'. The only Chinese ht's capable of handling
strong out-of-band signals as they should, are the Wouxun KG-UVD1P and the
Quansheng TG-UV2. The UV-5 R has somewhat more trouble surviving my QTH.

Sensitivity: not much difference between the three.

Audio: Wouxun UVD1P #1, Quansheng #2, UV-5R #3.

Battery life: Quansheng #1, UV-5R #2, Wouxun #3.

Scanning is painfully slow on any Chinese HT, I think they still don't
quite understand the concept. In my humble opinion scanning is generally
usable in channel mode, but near-pointless in VFO mode.

I don't know, Ken.

The use of PL tones is not common here. I would have to set up something to find out.

Thanks for the reply Hans. PL is very common here, both on ham and commercial channels.

Ken,

It was claimed earlier this year that when scanning, the UV-5R won't even stop on a channel that has an RX CTCSS (aka PL) frequency of 100Hz or less programmed in a channel. Within the last month or so, I've seen talk that frequencies even higher than 100Hz may be affected. Someone mentioned that the UV-5R probably needs to 'hear' a certain numbers of cycles of a tone to determine what it is. Since the lower frequencies have a longer cycle, the HT resumes scanning before the lower frequency tone can be determined. If you search the group with "100Hz" or "CTCSS 100" you will be able to read some of this commentary for yourself.

I have two UV-5Rs and a KG-UVD1P- all three work OK on scan but it is not a professional scan capability. You can set scan to Stop on an active channel (SE), Pause on an active channel (TO), hold on an active channel as long as it is busy (CO). You have no control of scan pause time on (TO) and no control of return to scanning delay, and not much in the way of Priority channel control. We do not program LCRs for Scan in our commercial use because of the limitations compared to 'real scan' using professional radios.

Subject: [baofeng_uv5r] Re: Cranky about the connector!

Gordon,
At least two individuals in the group have had this issue and were able to 'fix' it without 'surgery'. I believe repeated insertion/removal of a connector and/or blowing compressed air from a spray can of compressed air into the jacks were reported to do the trick. Apparently debris from manufacturing gets between the contacts and keeps them from making contact. So unless you are not being sarcastic and really 'can't wait' to open up your UV-5R, you might give this try.

I don't know if any of you have seen pictures of what is being sold on ebay as an ugrade version of the UV-5R. But just in case, I did a short video of the one I just received from Hong Kong with the extended life battery.
http://www.youtube.com/watch?v=riZl0wsILVQ
I love this radio and this new battery just takes the feel and the grip of the radio to a new level.

I like it. I want one. I see they have a blue one for my blue radio too!

You hit on a few of my complaints about the Wouxun. It feels fat in my hand, and the battery rattles around loose on it when you move it or shake it.

I like the extended battery because now it looks like it will fit in some of my other radio pouches where before it just went right to the bottom.

I dont like it, makes bigger than the tg-uv2, almost as big as a ft-250r height wise. what i like about the radio was its size, small enough to go nicely on the belt clip but not that big to make it uncomfortable. ive never complained about the battery, lasts long enough for my use. i would think the added weight would be an issue for me. dosent fatigue my hand if i grip for periods of time like my ft-250r does. you would think they would start using lipo's. very light, i am an avid rc heli pilot, and ive seen them used in smaller cordless appliances. expensive yes, but can be worth it for the weight trade off.

John, I understand and respect your opinion. The new taller radio is not for everyone. Different strokes for different folks!

Why buy a SMALL radio, then make it BIG? If I wanted a BIG radio, I would have bought a BIG radio. I have had NO problem with the 1800 mAh battery. It easly last all day. Then I charge it at night, if it needs it. My battery usually last two days. I just don't need all that size. I have big hands, but the UV5R feels just right like it is.

Just paid $20.50 on eBay delivered.
I agree that it might be overkill, but as a ham, I have to consider running around without power for periods of time. Having the extra juice will come in handy.
So my spare is like 2 batteries. Just in case.

Yes, it does. The footprint is identical to the radio itself.

Wouxun is pronounced:

Woah. Like what you say to a horse to stop it.

Shun: As in what you do if you ignore someone.

(x is pronounced sh)

2 syllables Woah- shun.

This battery is not going to be right for everyone, but I think it is right for me
I love the small size of the UV-5R, but that same small size gets me into trouble
When I carry the radio in my hand I inadvertently kerchunk the Repeater because there is not enough radio there for me to get a grip on it without my fingers wrapping around the PTT switch, and my hands are not particularly large
I think the extended battery will give me something to hold onto other than the switch area
Mostly I listen with the radio so the additional power is not an issue for me
But since I want to have a spare battery anyway it makes sense to me to buy the highest capacity battery available for the time, and I hope it never comes, when I do need 5400mAh of power

Since the battery is twice the amp hour rating its reasonable to assume it takes twice as long to charge.

4488. Correct Wouxun pronunciation, FWIW

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-16 18:26:14 UTC
From: Justin Moon
Topic: 4488 Message: 4488

I have studied Mandarin Chinese for 15 years now, and lived in Taiwan speaking way more Chinese than English for two of those 15. All of the pronunciations I've seen or heard for Wouxun so far are really close, but just not there. So here's my two cents, in an effort to spread the correct pronunciation to at least a few hams. First off, there is not an equivalent English sound for the second syllable. Straight from the Chinese characters, the name is pronounce Oh-Shun, except the U sound is like the German U with umlauts (two little dots above the letter). You shape your mouth like an O, and say EEE through it. The W on the front of the name is not pronounced, and must be just for looks, I guess.

As a rule of thumb, (in regards to the wouxun.us pronunciation link) never trust a narrator with perfect non-accented English to give you the correct Chinese pronunciation. ;) Oh-shing is not correct.

For reference, here is the Wouxun Chinese site. You can see the characters in the logo at the top of the page.

http://www.wouxun.cn/index.htm

And here is a Chinese character search engine, with the characters provided. You can click "Listen" next to the two characters and hear the correct pronunciation. The male voice that comes second is easier to distinguish for "xun".
http://www.nciku.com/search/all/%20%E6%AC%A7%20%E8%AE%AF

As I said, take this all as For What It's Worth. Feel free to spread this around, if you feel so inclined.

Justin

A full charge occurs when the battery reaches the voltage threshold and the current drops to three percent of the rated current. The intelligent chip in the charger keeps track of that.

Charging time should indeed be twice the time needed for the 1800mAH version. Theoretical, of course, as we don't know for sure what the real capacity of this 'monster' battery is.

Comparing charging times can only be done after both batteries went through a '3x drain completely, 4x charge completely' cycle. Only after this procedure both batteries will be at their full strength.

A temperature sensor is included in every Li-Ion battery, not in the charger itself. This is to prevent overheating due to a faulty charger, but normally this safety feature won't interfere with the charging process itself.

If you are going to use the desktop charger that comes with the 5r then a heat sensor is irrelevant, the rate of charge will be the same as for the 1800mAh battery.

So, have any FCC certified UV-5R's made it into the market? How about any certified for business band? Who's selling them?

The UV-5R is Part 90 approved. I have one from www.importcommunications.com with the FCC label inside. Use it for Ham and Commercial every day.

Hi,

I am tired of the software that comes with the programming cable. I am a software developer and I have developed other software to communicate with serial devices in the past.

Although I have never written radio programming software, I want to give it a try. Any idea where I can get the list of commands, and modes of communication with this radio?

Thanks

4500. Nagoya NA-771SF Antenna

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-17 02:20:30 UTC
From: kg4uuj
Topic: 4500 Message: 4500

Hi Everyone,

I finally received my Nagoya NA-771SF antenna (shipped from Hong Kong) today. It's 15 inches from connector to tip and weighs just under 2 ounces. It has 2.15db gain on 2 meters and 3db gain on 440mhz.

After connecting the antenna to the UV-5R I noticed a 1-2mm gap between the base of the radio and the base of the antenna. I'll see if I can find a rubber washer at the local hardware store to fill the gap.

I must say that the radio receives signals much better with the NA-771 than with the stock antenna. I went from being able to hear no repeaters at my home location with the stock antenna to being able to hear 4-5 repeaters using the NA-771.

Of the 4-5 repeaters I can hear I am able to transmit to 2-3 of them depending on propagation conditions.

I paid $12.20 including shipping for the antenna and so far I think it's great!!!

If you have any questions, just let me know.

Mike, KG4UUJ

CHIRP is GPLed, which means anything you derive from it must be GPLed (open and freely-available) as well.

It certainly would be more productive to contribute to CHIRP (many folks do) than to start something separate, IMHO.

I have attached a copy of the data file that is sent to the radio.

The little that I looked at it it seems to be a mix between dec/ascii and dec/hex. Code instructions are found toward the end with the first 128 locations being channel information.

I'm going to play with it a few days before I look at CHIRP as a programming option. If I decide to go that way, I'll get in contact with the project manager. I think I saw his name was Dan Smith.

My concept of how the software should look and work is very differnt than the current two options that I have seen. It appears that all the data is binary. I'll know more tomorrow. I have a program that allows me to see the communications between the radio and the com port. Since it is binary or a combination of text, hex and/or binary I'm setting up a terminal type app. allow me to hand enter codes and then receive data and view it. We'll see.

There's not doubt that CHIRP is real good software. The Beofeng version is about the worst piece of software I've seen.

Thanks for your responses.

Date: 2012-07-17 10:00:50 UTC
From: jecochard
Topic: 4308 Message: 4511

Thanks for the replies.

I use the Baofeng software VIP and non-VIP latest versions and CHIRP daily-20120706, both on Windows 7.

Under the Baofeng software my channel 0 is programmed as:
Band: VHF/UHF
RX Frequency: 476.82500
TX Frequency: 476.82500
CTCSS/DCS Dec: 75.0
CTCSS/DCS Enc: 75.0
TX Power: HIGH
W/N: N
PTT-ID: BOTH
BusyLock: OFF
Scan_Add: ON
SigCode: 7
CH-Name: LPF

When I "Download from Radio" in CHIRP, channel 0 is gray and displays:
Frequency: 0.000000
Name: ERROR
Tone mode: (none)
Tone and ToneSQL: 88.5
DTCS Code: 023
DTCS Pol: NN
Cross Mode: Tone->Tone
Duplex: None
Offset: 0.60000
Mode: FM
Power: this is blank
Skip: this is also blank

The way I test it is simply programming channel 0 in the Baofeng software, upload to radio, disconnect the software and read the same radio using CHIRP.

My radio firmware version is BFB251 (power on + 3)

Paul, tenorman1952,
yes, the closest I think you can get in English without the technical details is to pronounce it as "ocean".

Bill Maxwell, it has a definite "O" sound up front, so "ershun" seems less correct to me.

And to everyone else using a "wax on" pronunciation, I absolutely know where you're coming from. I have to use that kind of pronunciation when I'm talking to anyone, or they have no idea what I'm talking about. I just put the Chinese pronunciation out there because I know people are curious, and while it will probably never catch on, it's nice to know.

For curiosity's sake, Baofeng is pronounced Bow-fung. Bow like a performer takes a bow, and fung like fungus without the gus. That will never catch on either, so I'll keep on referring to them as bay-oh-fang like the youtube guy and everyone else. Bottom line is it's a great cheap radio to have fun with.

Cheers!

But how do you pronounce "ocean"?

To my ears, it can be "o-shun" or "o-shin". I think I say it both ways when saying the english word depending on how fast I'm talking...."o-shun" if I'm mellow, "o-shin" if I'm in a hurry.

Also, is either syllable emphasized, or are they equal? "O-shin", "o-SHIN", "o-shin"?

I'm not trying to make this complicated....really!

Now you're getting into the technical details! ;)

It would almost be pronounced o-shoon. But as I said earlier, there's an E sound in there too, so for an English speaker it would sort of become o-sheeoon. Sort of. Ocean as o-shun is a very close approximation too.

As for emphasis, this is where English and Chinese have a hard time correlating. Chinese has tones. So technically "O" is first or high tone, and "xun" is fourth or falling tone. What it amounts to is the O sounds emphasized over the xun. So "ocean" as it is said in english, with the emphasis on the O, is best.

The fun of Chinese is in the tones. In English you can use tones to change meanings, like when you say "I'm going there." as a statement, vs. saying "I'm going there?" You've changed a statement to a question, just using the tone of your voice. The fun in Chinese starts when you change your Mom to your horse by changing the tone of your voice. You can really get yourself in trouble if you stumble on a bad sound/tone combination.

More information than anyone wanted to know, I'm sure.

Justin

4517. Reverse mode quirk

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-17 16:37:08 UTC
From: mooneroid
Topic: 4517 Message: 4517

I own two UV-5Rs, a black one purchased in April, and a blue one purchased in June. Both report firmware version BFB231. When I am in "Channel Mode" on the blue rig, I can press */SCAN briefly and go into reverse mode. Pressing */SCAN again toggles back to normal. However, on my black rig, pressing */SCAN toggles to reverse mode momentarily, and then the radio goes right back to normal. It won't stay. If I hold */SCAN, it switches momentarily, goes back to normal, then starts the channel scan after a short delay. Does anyone else get this behavior? I don't use reverse mode a lot, so it's not a big bother, but I'm curious as to why the two radios would be different. I have programmed both radios with CHIRP and the same program file.

Any thoughts?

Justin

First time poster here :)

I bought a NA-636 and it was better than the stock for sure but very fragile. Broke near the base in little more than a week.

I've seen others recommend the 771SF and 775. I was wondering what other antennas have been tested with good results?

Hi Mike,

for the UV5R, look on eBay for the now famous $3.79 antenna, item# 180903233474. Else: the Nagoya NA-701.

Both antennas proved to be the best of the best in the lab. The word 'best' means a good to excellent SWR, sturdy, and a perfectly balanced performance on 2 meters and 70 cm.

Both antennas are a perfect fit for the UV-5R and don't leave a gap between the HT and the base of the antenna.

Presumably the SC951 SF (SMA Female)? I see my supplier didn't even list the Surecom products under UV-5R accessories so this is good feedback.

That particular Surecom is a 3-band antenna, which means even more compromises had to be made by the manufacturer.

I never tested this one myself, but the rating on eHam.net is nothing to write home about.

Wow! At that price it's not even worth looking up reviews. I just ordered 4. Thank you.

Any recommendations on single frequency antennas ... for example, if I was trying to maximize VHF repeater reach?

I have purchased 2 of these on Ebay from different vendors, they both work great.

One showed up with a mirrored Nagoya label at the base, the other with blue Nagoya printed on the base of the antenna.

One has a magnetic tip, the other does not.

I have tested both at and beyond their limits with a distant repeater, they behaved the same.

I don't know which is authentic.

Brilliant Dan!

Looking at the debug log I found where the error is and it is NOT with Channel 0. It is with reading non-standard CTCSS tones.

The OEM software allows any CTCSS tone between 60.0 and 259.9 to be entered but CHIRP generates an error if it reads a non-standard CTCSS tone from the radio.

I use 75.0, which is non-standard (used handheld to handheld not to accidentally trigger a repeater or the SQL of another handheld.). The OEM software allow to set the CTCSS tone from 60.0 to 259.9 in 0.1 increments.

Setting CTCSS to a standard value removes the "channel 0" error.

I have thus opened a different bug (i.e. non-standard CTCSS read) on the website.

Again thanks,
JL

Ah, good detective work.

The design of chirp makes supporting this "feature" rather difficult,
and thus, I won't be changing it just for this one model that supports
this weird behavior.

Note that as long as you don't touch memories that are ERROR'd out like
that in CHIRP, it won't try to "fix" them.

Thanks for understanding.

Reading suggestions from users of the UV-3R, on that yahoo group, I purchased a Nagoya NA-701 SMA-M, which was very noticably better than the stock stubby rubber duck.

Naturally, when I purchased the UV-5R, I bought the similar Nagoya NA-701 SMA-F. It screws on solidly, flush against the radio, and performs well, too.

BTW, you can also screw the SMA-M and SMA-F antennas together to form a nice dipole. Only problem is, I can't figure out how to connect to the feedpoint.

I am trying to get CHIRP set up on my MacBook Pro running under OSX Lion
I have installed the Prolific 2303 driver from
http://changux.co/osx-installer-to-pl2303-serial-usb-on-osx-lio
and tested the programming cable in terminal
I have installed the Python runtime and the 7/14 CHIRP daily build
When I plug the cable into the computer and radio the transmit light comes on as soon as I turn the radio on
I don't remember that happening when I was working on an XP box
Is this normal or am I really transmitting
If I am transmitting what is my problem and what do I need to do to correct it
Thanks

First I am not sure this is where this belongs - my apologies.

I have a Baofeng UV-5R. My daughter and wife communicate via Motorola talkabout walkie talkies on the Family Radio Service network. I have downloaded the frequencies they talk most on and uploaded them to the UV-5R via Chirp.

My question is: If I am using the FRS bands Do I need to follow Amatuer radio Protocols calling my ID every ten minutes ? or can I just chat as if I were on another talkabout and not the UV-5R ?

thanxs & 73

I also have the FRS frequencies programmed into my radios for the same reasons... Just be aware that you exceed the power an FRS radio is limited to. FRS radios are limited to 500mW (1/2 Watt) unless I am mistaken.

Hi,

I am tired of the software that comes with the programming cable. I am a software developer and I have developed other software to communicate with serial devices in the past.

Although I have never written radio programming software, I want to give it a try. Any idea where I can get the list of commands, and modes of communication with this radio?

Thanks

Like many other folks I jumped at purchasing one of the Baofeng UV-5R hand held radios. In my case I also purchased USB to serial programing cable. It's been a trip for sure. After receiving the radio I tried loading the software that was on a mini CD disk that came with it. That didn't seem to work so I tried downloading the software found on the www.409shop.com site. That download didn't work any better. All I got was many "?" across the page. After that I sent the radio back back to the 409 shop for repair. They tested it out and said it was OK... That response was not expecrted so I told them to return it to me. I am currently waiting for to come back.

Can one of you fine folks out there please tell me where I can download a good serial port driver and UV-5R control software. If this fails I am going to 86 the cotton picken thing.

Thanks,

Terry W7KW

The NA-775 is a great little antenna if you get the right one, a 21.1 cm version sometimes called NA-775S or NA-S775.
There is a longer antenna also called 775 which I have heard is terrible and may be a counterfeit (ie not even made by Nagoya). It is 40-ish cm and has blue stenciled "Nagoya 775" lettering, not the traditional silver on black Nagoya sticker.
To further complicate matters, on eBay I now see a long version with the correct markings, an NA-775L. Don't know about that one, but it's probably cool.
Make sure you get the right interface too.Ian

K4BBW is correct on the power usage. this is exactly why I asked. I will rephrase the question.

If I am using more power than the FRS radios do on the same frequencies as FRS does this constitute Amatuer usage and thus require amatuer protocols ?

It's some type of group setting which I do not need. On my radio, this
was set to "1". I have not changed it and my radio works just fine.

I would suggest that you ignore it for the time being. Eventually someone
will post an explanation of how you can utilize this particular function,
but for the time being, I would just "let it go."

Terry,

The software that comes with the unit leaves a bit to be desired and the learning curve is stretched out some but I assure you that the radio and the software work and will once you get the hang of it all. Also Chirp (a open source software package) is a great alternative but also requires about the same learning curve. I use both.

Once you get your radio back check out the Files section of this group and you should find all of the answers as I do not think that you can come up with a problem that has not come before the group since February.

The ???? on the software menu can be fixed by clicking on the second set from the right and selecting "English"..... you have to do this each time you use the program.
You will find all the help you need right here and we throw in lessons on pronuncing various Chinese names like BaoFeng and Woxoun at no extra charge. So bear with it and you should be happy when all of the kinks are out !!

Family Radio and Amateur radio do not share any frequencies, so you would not want to use amateur protocols on Family Radio frequencies.

If you are concerned that you might be operating illegally on Family Radio frequencies, then don't do that. You could disable TX on those frequencies and buy one more Family Radio.

If you believe, as I do, that the F.C.C. has a *lot* better things to do than check to see if you are operating with a little more power than is permitted on Family Radio (which is virtually unregulated anyway), then I would use Family Radio frequencies on your radio to communicate with family members on Family Radios. I cannot think of any possibility where this would cause any sort of problem to anybody else that could not be solved by someone changing channels, which is sometimes necessary when two families are communicating on the same channel inside an amusement park or other venue.

In other words, don't worry about it.

Yes, I'm a scofflaw, but remember that one of the choices (above) was to NOT operate on FRS frequencies with your amateur radio.

As they say, "the choice is yours."

Technically a ham radio is illegal to use on any non ham band. With that said I'm sure many do. However if caught you most likely would lose your ham license. Probably won't but always possible.

Subject: [baofeng_uv5r] Re: quick questions regarding FRS (Family Radio Service)

K4BBW is correct on the power usage. this is exactly why I asked. I will rephrase the question. If I am using more power than the FRS radios do on the same frequencies as FRS does this constitute Amatuer usage and thus require amatuer protocols ?

Take heart Terry, you are indeed just "like many other folks" in having these problems.
 They are fixable. You just have to know where to look for answers.
First there are the cable driver issues. These will grow hair on your eyeballs if you don't know what to do. Go to the "Files" section of this Yahoo group, and look in the directory "Programming Cable and Drivers" for a .PDF guide (written by me). It will explain and walk you through.
If you still have your cable and didn't send it back with the radio, you can sort out this first hurdle while you're waiting for your radio to come back.
Then, there is the programming software. The Baofeng software is dismal, but does work.
 There are two "gotchas" lurking in it.
1. All menu items are "????" because the default when it comes up is Chinese, and your average westerner doesn't have the funky character set installed. 2nd from the right menu item will let you choose between Chinese and English. Problem solved, until next time you run the program and have to select English again.
2. The defaut COM port in the program similarly comes up as COM1, and you have to set it whatever COM port your cable is on. (After sorting out your cable issues you will know what this means.) To change it, look under "Communication". The program has amnesia and you have to set it each time you run it.
You can set up your programming while you wait for your radio too, but,...
Look into CHIRP. That is an open source poly-literate radio programming software program which many of us use. Support for the UV-5R is being added by its very active and accommodating developer as we speak. The CHIRP site
is http://chirp.danplanet.com/projects/chirp/wiki/Home
To use it with the UV-5R, you have to install and run the "Daily Builds" (under development) version of the program, at http://trac.chirp.danplanet.com/chirp_daily/
Another famous and very popular rabbit hole in which many of us have twisted our ankles:
 the cable feels like it's plugged fully into the radio when it is not. Really. Give it an extra hard push. Some have actually had to resort to carving away some of the plastic with a razor blade to get it to go in far enough.
Take a deep breath, go thru these steps, and all will eventually be well. Let us know how you make out.

Like many other folks I jumped at purchasing one of the Baofeng UV-5R hand held radios. In my case I also purchased USB to serial programing cable. It's been a trip for sure. After receiving the radio I tried loading the software that was on a mini CD disk that came with it. That didn't seem to work so I tried downloading the software found on the www.409shop.com site. That download didn't work any better. All I got was many "?" across the page. After that I sent the radio back back to the 409 shop for repair. They tested it out and said it was OK... That response was not expecrted so I told them to return it to

me. I am currently waiting for to come back.

Can one of you fine folks out there please tell me where I can download a good serial port driver and UV-5R control software. If this fails I am going to 86 the cotton picken thing.

Thanks,

Terry W7KW

#1 - it's been mentioned here previously, it is 'common' readily available knowledge - Part 90 radios are NOT Type Accepted for FRS which means it is illegal to use them on FRS - no matter the power or bandwidth settings.

#2 - since #1, and that FRS is an unlicensed radio service, thus no callsign, using any identification, specifically that of another service (ham, GMRS, public safety, business, etc. - none of which provide cross-service privileges) is illegal.

Using identification from another service is a backwards implication that you are operating that license/service illegally outside of spectrum that license is intended for.

I think monitoring any of the lo-VHF CB channels 1-40 provides a fair indication of the behavior/protocol anticipated on much of the FRS service.

Not sure how many in this group are lawyers, much less specialize in communications law - but your mileage and interpretation of the documented laws for each service may vary.

Either way - the typical base $10,000 fine makes many poor radio decisions cost prohibitive. Lots of sleepy-time reading in Part 15, Part 90, Part 95 and Part 97... which if you have a license for any of those services it is incumbent on you to get familiar.

Technically, a transceiver for the FRS and/or GMRS bands needs to be type approved for FCC part 95. The UV-5R is approved for part 90.

If the talkabouts are 22 channel and you are not limiting their use to channels 8 through 14 (1-7 would be OK too if you make sure you are always on the low (.5 watt) power setting), then you would technically need a GMRS license to use them.

You definitely wouldn't want to call attention to yourself by using a ham callsign.

Good info Hans. But, an antenna for 146 and 430 MHZ are a better match. The 3 to one frequency means the 1/4 wavelength on 146 becomes a 3/4 wavelength on 430. The impedance will be a fairly good match on both bands. I used a 1/4 wavelength 2 meter mobile antenna very effectively on both bands for years.

One caveat. The FRS is limited to 0.5 watts. Your ERP with the dummy load (read antenna) will put you in that range as it causes a 3-6 dB loss.

Terry,
Like others have said, what I call the 1st version and the VIP version of the Baofeng software comes in Chinese and have to, as was described, changed to English to get rid of the ???. This change is not remembered so you will have to do this every time the software is launched. What I call the 2nd version comes up in English. All three are available in the files area. The 2nd version is "UV_5R_P 20120425.rar"

Hi,

No. Amateur service is on Amateur service frequencies. Use of above legal power on FRS hannels constitutes, at best, illegal use. It might be legal use if you're using the GMRS/FRS shared channels, or rather, the channels that GMRS can use with higher power and wider deviation. However, even with non-type-accepted radios, and understanding I'm treading on dangerous ground here, this would still be, technically, illegal use.

Would anyone complain to the FCC about your use of one watt vs. 500 milliwatts, or your use of a not type accepted radio? Not likely, unless you made an issue of it yourself. But do be aware that, regardless of who may or may not complain, you're no on unassailable legal ground and decide accordingly.

If nothing else fails your radio for FRS, FRS radios must have non removable antennas.

I haven't been able to reach my nearest repeater yet (about 6.5 miles away) from home, but I'm waiting for my NA701 and 771 alternative antennas to arrive, to see if they will help.

I've also ordered a mag-mount antenna to try the UV-5R as a mobile, but which I could also use at home - probably attached to the washing line post, and with a ground plane. I'm intending to use some lengths of aluminium (I'm British - that's how we spell it!) tube for the ground plane. What is the shortest reasonable length of the ground plane for 70cm and 2m bands, or is it not particularly critical?

regards,

Martyn , M3MDY

If you are not hitting a repeater that close, somethng else is up. I hit repeaters between 28 and 39 miles from where I live. I did a 440 line of sight at about 22 miles.

You may want to check your programming.

Says it suits the Wouxun KG-UVD1P and Quansheng range, which are pin and antenna compatible,so it should certainly work on the UV-5R.

Subject: [baofeng_uv5r] quick questions regarding FRS (Family Radio Service)

First I am not sure this is where this belongs - my apologies.

I have a Baofeng UV-5R. My daughter and wife communicate via Motorola talkabout walkie talkies on the Family Radio Service network. I have downloaded the frequencies they talk most on and uploaded them to the UV-5R via Chirp.

My question is: If I am using the FRS bands Do I need to follow Amatuer radio Protocols calling my ID every ten minutes ? or can I just chat as if I were on another talkabout and not the UV-5R ?

Based on the original question I am going to assume you are not familiar with Part 95 rules about FRS. Something else you will want to be aware of. Your UV5R transmits at either double or 10 times the legal limit of FRS. The radio is not legal for use on FRS. Since the radio transmits more power than allowed and has a removable antenna, using your 5R could be seen as unlicensed operation of a GMRS station. You're Amateur Radio license is only valid for operating an Amateur Radio station on the frequencies authorized for your license class. It does not. Cover FRS, GMRS, MURS or any other radio service, and it certainly does not authorize you to use unauthorized equipment on FRS.

I'm not telling you to stop using it, that's entirely your decision, but I am making sure you know the risks involved.

If you are using more power than the .5 watt limit for FRS and you are on channels 1-7, you are required to have a GMRS license. Channels 15-22 require a GMRS license at all power levels. Your UV5R is not certified for use with FRS or GMRS.

Using your ham radio callsign to identify while operating an unauthorized trasnmitter is a good way to lose that callsign.

In the States you need a license for GMRS. In Canada you do not.
The first 7 channels are shared between FRS and GMRS, and you can operate them without a GMRS license if you are using a 1/2 watt FRS radio. Or, if you have a GMRS license you can run 5 watts on those channels.
The next 7, (channels 8 thru 14) are reserved for FRS only. Although GMRS radios generally do include those channels, the power is limited to the FRS 1/2 watt.
The next 8, (channels 15 thru 22 on most GMRS radios), are GMRS only. 5 watts in Canada.
 I believe you GMRS licensed Americans can run much more aggressive setups, but I'm not sure of those details.

The FRS bands are not Amateur radio bands. FRS- Family Radio Service. There for you do not need a license or identify on FRS. Please do not use your ham call outside amateur radio bands. That would be a BIG NO NO. you do need a license if the frequencies used fall into the GMRS bands.

I just bought 2 radios.
Both are reset to factory default using the keypad.
Both are set to UHF 477 in VFO mode.
When I press PTT on radio A I hear my voice on radio B. All good.
When I press PTT on radio B it triggers the squelch on radio A but I cannot hear my voice.

What I am doing wrong?

Thanks,
JL

Thanks Dan, your post should end this thread. Use it if you want, but KNOW it is NOT a FRS or GMRS radio. If you want to give up your Ham license, go ahead at your own risk. Why not just go buy a radio that is made for those bands and keep your Amateur Radio License safe.

David - W4DSM

There are not less than three cable programming interfaces in the files area that would have the info that you need. Here is the name of the first one a came across.
uv-5r-interface.jpg

There's also one in the "Programming cable and drivers" folder.

Also if you search the group with "pinout" there are some good descriptions. Message 3583 is a good example.

There have been more that a couple of UV-5Rs that have had debris or something in the mic jack keeping it from closing the circuit when the mic cable is removed. I would plug in an external mic a few times and maybe give it a shot of compressed air from one of those cans of compressed air to clean keyboards and such. I haven't done it but is has been reported to work for others.

I don't know that CHIRP modifies anything, I believe that is just lets you utilize what the HT is already capable of. For example, with CHIRP I believe (I haven't done it myself) you can program RX (and TX) all the way up to 512MHz. Is that what you were asking?

> I own two UV-5Rs, a black one purchased in April, and a blue one purchased in June. Both report firmware version BFB231. When I am in "Channel Mode" on the blue rig, I can press */SCAN briefly and go into reverse mode. Pressing */SCAN again toggles back to normal. However, on my black rig, pressing */SCAN toggles to reverse mode momentarily, and then the radio goes right back to normal. It won't stay. If I hold */SCAN, it switches momentarily, goes back to normal, then starts the channel scan after a short delay. Does anyone else get this behavior? I don't use reverse mode a lot, so it's not a big bother, but I'm curious as to why the two radios would be different. I have programmed both radios with CHIRP and the same program file.

Jerry,

Most of the mikes for the UV-5R have an 1/8" speaker/earphone jack at the base of the mike. I just Googled UV-5R speaker/mike on Ebay. About $8-$10.

I have to agree. It is illegal to use the the UV-5R to transmit on the FRS frequencies, licensed or not, because the radio exceeds power limits and it has a removable antenna.

Having said that, it's very unlikely that the FCC is going to send the spectrum police after you for using the UV-5R. Even still, if you were caught by the FCC they rightfully could confiscate the gear, fine you, AND you could lose your amateur license. If I were going to use the radio on the FRS frequencies, the last thing I would do is give my amateur call sign!

On the GMRS and MURS frequencies you would be legal IF you possessed a license for that allocation. (Those licenses are expensive!) I would assume the same is true for all of the rest of spectrum the UV-5R covers.

> No. Amateur service is on Amateur service frequencies. Use of above legal power on FRS hannels constitutes, at best, illegal use. It might be legal use if you're using the GMRS/FRS shared channels, or rather, the channels that GMRS can use with higher power and wider deviation. However, even with non-type-accepted radios, and understanding I'm treading on dangerous ground here, this would still be, technically, illegal use.
>
> Would anyone complain to the FCC about your use of one watt vs. 500 milliwatts, or your use of a not type accepted radio? Not likely, unless you made an issue of it yourself. But do be aware that, regardless of who may or may not complain, you're no on unassailable legal ground and decide accordingly.

Jerry,

Most of the mikes for the UV-5R have an 1/8" speaker/earphone jack at the base of the mike. I just Googled UV-5R speaker/mike on Ebay. About $8-$10.

anybody know where I can find a hand held external mic for the uv-5r with only mic port pin ?
that would allow me to use the speaker pin out for external speaker or blue tooth dongle.
any info would be appreciated.

I looked at the GMRS license, $85. Still, if I'm remembering right it
covers everyone in the household.

MURS does not require a license, but from the way I understand the regs,
the UV-5R is not legal to use on it.

GMRS licenses are not expensive in terms of anything except, and I say
this lovingly, a cheap Chinese radio group. They are $85 for 5 years,
which comes out to $17 a year.

It also covers the 160mHz boating band, I have no idea if you need a
license for those radios, or any other regs.

Far from the reach of the FCC, although it is illegal in those countries
"American channel 3" has become the international calling and distress
frequency for 4 wheel drive vehicles. High power LMR radios on those
channels demand a premium.

Geoff.

Thanks John! I did have one rig in dual watch and the other not. I didn't notice that. That's a very handy little tidbit of knowledge.

> > I own two UV-5Rs, a black one purchased in April, and a blue one purchased in June. Both report firmware version BFB231. When I am in "Channel Mode" on the blue rig, I can press */SCAN briefly and go into reverse mode. Pressing */SCAN again toggles back to normal. However, on my black rig, pressing */SCAN toggles to reverse mode momentarily, and then the radio goes right back to normal. It won't stay. If I hold */SCAN, it switches momentarily, goes back to normal, then starts the channel scan after a short delay. Does anyone else get this behavior? I don't use reverse mode a lot, so it's not a big bother, but I'm curious as to why the two radios would be different. I have programmed both radios with CHIRP and the same program file.

Charles, that is not correct. A UV-5R is only Part 90 certified. FRS & GMRS requires Part 95 certified equipment.

On the GMRS and MURS frequencies you would be legal IF you possessed a license for that allocation. (Those licenses are expensive!) I would assume the same is true for all of the rest of spectrum the UV-5R covers.

Yes. The GMRS license covers the licensee and their family. That includes people who are family but not part of the household.

anybody know where I can find a hand held external mic for the uv-5r with only mic port pin ?

that would allow me to use the speaker pin out for external speaker or blue tooth dongle.

any info would be appreciated.

Thanks. It is not Tone issue. Tone is disabled.
Also if I use an external microphone it transmits perfectly.
So it seems that it could be that the intnernal microphone gets bypassed.

I discovered that a metal paperclip just fits in the mic hole of a UV-5R. Use one to make sure that the hole is open on the inside of the case. If I stick one into mine gently without twisting or pushing hard (to avoid damaging the mic beneath) it goes nearly 7/32"(5.6MM) deep. If your paperclip goes way short of that then I would expect that you mic hole does not go completely through.

I'm beginning to feel that the manufacturing process does not ensure that the hole on the inside of the case is completely open and this is why we get various degrees of TX audio reports and at the same time a good report from an external mic.

There have also been many claim that gently drilling the hole out (by hand) had cured their audio issues. This would clear the partially opened hole and depending on the size of the bit, even make it a little larger.

It seems that on some of these units that the mic hole is blocked and/or not drilled all the way through. Some folks have used a 3/64 ot 1/16" drill bit BY FINGERS to ream out the hole. and it has solved their problems.

Just ordered one.... female SMA, 21.1 cm, silver on black.

I'm intending to use some lengths of aluminium (I'm British - that's how we spell it!) tube for the ground plane. What is the shortest reasonable length of the ground plane for 70cm and 2m bands, or is it not particularly critical?

I beg to differ. The GMRS licenses are rather expensive when compared to an amateur radio license at only $15 for ten years. $17/yr compared to $1.50/yr is a lot.

When compared to the FRS, MURS and CB licenses, which are effectively free since you don't need one, they are infinitely more expensive.

Or, perhaps you would compare the cost of the license to the cost of the radios being used for that license. With GMRS, it's easy to get a brand new radio that costs a mere third of what the license costs. Seen any $5 radios that work in the ham bands lately?

Yet another way to look at it is that it costs about 10 hours of wages for a minimum wage employee. For many people, giving up a fourth of their weekly pay check would be considered expensive.

Just sayin'

When did they go up in price? I thought they were still free in the US.

>
> When compared to the FRS, MURS and CB licenses, which are effectively

IMHO a bad comparison. If you want to us those services, you still have
to buy a radio, and you are limited to what you get for them.

Exactly where do you get a legal GMRS radio for $5?

> Yet another way to look at it is that it costs about 10 hours of wages

Even if the license was free, they would have to buy radios.

At minimum wage, how much time would they have to work to buy a family's
worth of GMRS radios (not MURS, NOT FRS, NOT CB)?

Geoff.

4612. chirp duplex settings

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-18 19:18:06 UTC
From: unalias2
Topic: 4612 Message: 4612

In a previous post (4428)the quest to inhibit transmit on a specific channel was resolved by setting the duplex setting to <off>. I have the latest build (20120714) and in duplex I find only four options; <blank> = none, <->, <+>, and <split> but no setting for <off>. From what I understand it was added with this revision, and I don't see any more current revisions. Can someone point me in the correct direction? I am guessing it can be set, I just can't figure out how to make this change.
thanks
note: sorry if this posts twice, having a bit of issue with getting it posted

Charlie

If you are unable to find an <off> setting, just enter a split transmit frequency that is out of the range of the radio. If you do hit the PTT by accident, the transmit will be inhibited.

Actually, an Amateur Radio license is free. It's the test that costs, or else a vanity call costs. The operator license itself, however, as well as the original and subsequent, non-vanity station licenses, are free.

4620. Re: Better charger

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-18 22:06:14 UTC
From: Jim
Topic: 4143 Message: 4620

I received my TYT BCG-F8 charger today. Amazingly it only took 9 days to be delivered. Nearly everything I've ever ordered that has been shipped from Hong Kong takes about 20 days to show up.

The charger base and wall wart is pretty much as jziggity12 described it. The only difference at all with his I have to his comparison is that my original wall wart that came with the UV-5R is exactly the same part number and voltage as the wall wart that came with the TYT charging base.

An 8.4 volt wall wart sounds like a mistake to me. I would think that the input voltage would need to be higher than the regulated output voltage (8.4 volts). With an 8.4 volts wall wart I think I would expect charging problems.

409shop sells the 12-volt wall wart as a separate item for $6.50 shipped. But for what appears, so far, to be a better charging base, the TYT charger is only $13.50 shipped (including the 12-volt wall wart).

I got my new charger base so I would be able to have charging base at work as well. I'm now considering getting another charging base because, with the proper power cable, it ought to work great to charge a battery in the car.

4622. Re: CHIRP questions

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-18 22:20:07 UTC
From: Jim
Topic: 4617 Message: 4622

Kenn,

You are using a stable release of CHIRP. You have to use a developmental build (aka chirp daily) with the UV-5R.

I have an ICOM IC-Q7 and a Kenwood TH-F6 with programming cables. I'm pretty sure CHIRP supports them both. So I need to take the time to learn how to do what you are asking about.

I don't think it is as simple as download from one radio and then upload to the other. It's probably more like download from radio 1. Export the channel data to a file. Download from radio 2 (to get a template for that radio). Import the channel data. Upload to radio 2. But since I've never done it I may be completely wrong.

In any case, what you are asking to do is doable. That's one of the great benefits of CHIRP.

Jim KC9HI

WOW. I was ismply inquiring as I was reading over part 90 of the FCC rules and wanted clarification which I received that I could not use the UV-5R without breaking some rules.

Although everyone has an opinion about how far the FCC would take this, or whether they would even persue it, and whether GMRS would qualify.

My sincerest apologies for opening up such a topic. I simply wanted to rely on the opinion of those with more knowledge in the field. The FCC Rules are complex and sometimes I have to reread them two or three times to truely understand them.

I received the answer I needed and have opted to use a FRS store bought radio. It is inconvienant to carry two radios but keeps me in compliance.

thank you every one, and sorry for creating such a hot topic.

You're partly correct. Basic licenses are still free to *renew*, but you usually pay $15 to get it initially. Which, actually, makes my point even more since the GMRS licenses aren't free to renew making them even more expensive.

Regardless of which service you use, you have to buy a radio. Whether it's GMRS, FRS, CB, Ham, whatever... you need a radio so I don't see how that really plays into the discussion of how expensive the license is for GMRS.

> > Or, perhaps you would compare the cost of the license to the cost of the

>

No place I know of. What I said was that the GMRS license costs about three times what the license for that service costs. Since a ham radio license is $15 up front, that would be the equivalent of getting a ham radio for only $5 and that's impossible. Hence, the GMRS license is expensive.

To get the price on the GMRS radios, I just put something like "GMRS radio" into Google shopping search and one of the first ones was a pair of two for $30. Oh, my. I just realized I didn't factor in the fact that it was for a pair of radios. Let's see, that means that the GMRS license is about 6 times the cost of the radio. Seen any $2.50 ham radios lately?

Again, irrelevant to how expensive a GMRS radio license is. It seems awfully odd to me that with GMRS radios overlap with FRS radios, the fact that they allow a little more power and some other features doesn't justify taking the license from free for FRS to $85 for GMRS.

4626. UV-5R "Voice" and volume

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-18 23:07:05 UTC
From: Laura KI6AOK
Topic: 4626 Message: 4626

I've been reading this group for several weeks as I awaited the arrival of my UV-5R and noticed the remarks about the Chinese accented voice, as well as the fact the volume cannot be turned completed down. I'm happy to say that my UV-5R (in yellow) has an American accented voice (which I promptly turned off because she got annoying) and the volume can be turned completely down. I don't know if this is a new batch of radios, but I thought I would mention it.

I'm on my second renewal of my GMRS license. Yes, your correct a GMRS license is way more expensive than for a ham. However for those of us who didn't want a ham license, GMRS is a great alternate. I belong to a REACT group and we have repeaters. Also my wife will never get a ham license so GMRS allows me to talk to her though a repeater.

Equipment, my radios for GMRS are all Kenwood Part 95 commercial radios, TK-390's at present and TK880H mobiles. I use none of the toys you find at Walmart. I also have a mobile repeater in my car.

So yes, some of us GMRS users take our side of the hobby as serious as some you hams.

Actually the Amateur Radio License is free. The fee (if any) paid at the
testing session is to reimburse the test provider for administrative expenses.
If you take an amateur radio license exam from a VE affiliated with the
Laurel VEC the exam is free (http://larcmdorg.doore.net/vec)

I've picked up much info from the group, but still not hitting on the right mix. I have downloaded the programming software and I thought were the USB drivers but when hooked to cable and click read from or to radio it comes uo wrog comm port. I have the cable with the USB to the Two pin connector. I have Windws 7 and Windows XP. Any help would be much appreciated.

Thanks again for being a great group.

Ed

Charlie,

I just booted up my Windows Vista machine and had the same issue until I found the "right" driver for it. That leads me to beleive that the Mac isn't the problem so much as finding the right driver will be. I'll let you know if I find anything but now that I am able to program from my windows machine, I may not mess with it on Mac.

4637. scanning memory channels with R-CTCSS

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-19 02:52:04 UTC
From: Cap Pennell
Topic: 4637 Message: 4637

Testing with another radio, I've found that while scanning programmed UV-5R memory channels in channel mode, the scanning does not stop for signals on those memory channels when those memory channels include R-CTCSS (Menu Item 11) settings lower than 141.3 Hz (136.5 Hz and lower). But the memory channel scanning will stop on signals (and the signals will be heard thru the speaker) when those memory channels include R-CTCSS settings of 141.3 Hz and higher (regardless of the actual CTCSS being received on those channels). Eh?

However, programmed R-CTCSS works properly (selectively) in channel mode while _not scanning_ the channels.

So, for the ham repeaters around here which do Transmit a CTCSS (PL) Tone lower than 141.3 Hz which I'd like to include in my UV-5R's memory channel scanning sequence, I've programmed a duplicate set of memory channels, each set with R-CTCSS OFF. Then to SKIP the (twin) memory channels that are programmed with a R-CTCSS lower than 141.3 Hz I've had to use the programming software, but I can still select those memory channels to use for transceiving, one channel at a time. <grin>

73, Cap KE6AFE

P.S. Is there already a "wish-list for the next UV-5R firmware revision" available somewhere?
I'd like the option for backlight on key press ONLY, and R-CTCSS that functions in channel mode scan.

These guys are brutal...

In the US, you'll pay a few dollars more from Import Communications, but local a local warrenty and service is tough to argue with.

I'm sure I will, just not tonight. I'm just happy to have some programming done and have alphatags!

I am glad I am not the only one
Not that I am wishing radio/computer problems on anyone but at least having company makes me less inclined to think it is something I did wrong
To rule out the possibility that my cable has gone south I did plug it into the radio but not the computer and when the radio is powered up it does not go into transmit mode

I've been watching the prices drop on eBay, seeing some bundles at decent pricing. Saw a radio plus speaker mic in the mid $60's. The radio and 3600 mAH are going at a good price. After my battery gets here and I see how I like it, I might pick up my second 5R that way.

Ok, looks like this thing has the correct jack setup for the 5R. Do the plugs work like a speaker mic routed through the box?

I was just browsing and saw it. Don't know that I'd need one, but the concept is intriguing.

A GMRS license is a system license in the same way a Part 90 license is for a system. In the case of GMRS, it covers family members the same way a biz license covers employees. For me, the $85 was a large expense, but as family members in crease, the cost per user goes down. So, if you have 10 users, that's $8.50 per user. $85 for a license for 8 UHF repeater pairs, 7 simplex channels and up to 50 watts is a small price to pay. GMRS is perfect for families who want radio comms but are not interested in the technical aspects of Amateur Radio, and in my opinion, families or anyone else who gets a ham ticket for the express purpose of communication amongst themselves with no interest in being involved or contributing to the amateur radio community are a waste of a license anyway. Comparing Amateur Radio to GMRS is like comparing running a hog farm to running a greenhouse.

You're partly correct. Basic licenses are still free to *renew*, but you usually pay $15 to get it initially. Which, actually, makes my point even more since the GMRS licenses aren't free to renew making them even more expensive.

Regardless of which service you use, you have to buy a radio. Whether it's GMRS, FRS, CB, Ham, whatever... you need a radio so I don't see how that really plays into the discussion of how expensive the license is for GMRS.

> > Or, perhaps you would compare the cost of the license to the cost of the

>

No place I know of. What I said was that the GMRS license costs about three times what the license for that service costs. Since a ham radio license is $15 up front, that would be the equivalent of getting a ham radio for only $5 and that's impossible. Hence, the GMRS license is expensive.

To get the price on the GMRS radios, I just put something like "GMRS radio" into Google shopping search and one of the first ones was a pair of two for $30. Oh, my. I just realized I didn't factor in the fact that it was for a pair of radios. Let's see, that means that the GMRS license is about 6 times the cost of the radio. Seen any $2.50 ham radios lately?

Again, irrelevant to how expensive a GMRS radio license is. It seems awfully odd to me that with GMRS radios overlap with FRS radios, the fact that they allow a little more power and some other features doesn't justify taking the license from free for FRS to $85 for GMRS.

Last time I looked the rules were a bit vague about that. I asked Hollingsworth about 4 years ago and got an answer just as vague. I do know that spouse, kids, siblings and parents are covered, but I do not know if it covers in-laws.

As I understand things, one license covers all family members down to, but not including, cousins. However you may not want family members not living in your area to use your license as you are responsible for their behavior.

Cap,
Nice job!. It has been know for quite some time now that the UV-5R has issues scanning with the lower frequency R-CTCSS tones. I don't believe that anyone has gone to the trouble to do any detailed testing and report it to the group like you have. Thank you.

Also, thanks for sharing your scanning workaround. Clever.

From: charlie_kc2ped
Topic: 4652 Message: 4652

If this diagram can be confirmed and we can get the corresponding pin outs for for the other end of the wire we can build our own DB9 cables to plug into a USB to Serial converter with a genuine Prolific chip in it and not have so many driver issues
It would be more expensive than buying the cable from China but at least you would have a better chance of it working

4653. Re: GMRS licenses are expensive

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From the Part 95 GMRS rules:

95.179 Individuals who may be station operators.
(a) An individual GMRS system licensee may permit immediate family members to be station operators in his or her GMRS system. Immediate family members are the:
(1) Licensee;
(2) Licensee’s spouse;
(3) Licensee’s children, grandchildren, stepchildren;
(4) Licensee’s parents, grandparents, stepparents;
(5) Licensee’s brothers, sisters;
(6) Licensee’s aunts, uncles, nieces, nephews; and
(7) Licensee’s in-laws.

The only vague part about that seems to be the in-laws. If I had a license, I would interpret that to mean if it applies to any blood relation of mine, it applies to the same blood relations of my wife. So my wife's parents, grandparents, siblings, nieces, nephews, etc.

For me, the $85 was a large expense, but as family members in crease, the cost per user goes down. So, if you have 10 users, that's $8.50 per user. $85 for a license for 8 UHF repeater pairs, 7 simplex channels and up to 50 watts is a small price to pay. GMRS is perfect for families who want radio comms but are not interested in the technical aspects of Amateur Radio, and in my opinion, families or anyone else who gets a ham ticket for the express purpose of communication amongst themselves with no interest in being involved or contributing to the amateur radio community are a waste of a license anyway. Comparing Amateur Radio to GMRS is like comparing running a hog farm to running a greenhouse.

I'm going to have to admit to being stunningly lucky on this topic. I have read as much as possible on this group site while awaiting my cable delivery. My understanding was that, using CHIRP, I would download from radio, save to csv (etc), edit, re-open in CHIRP and upload to the radio. What I have discovered is that I can edit the fields right in the CHIRP window and upload back to the radio without any other editing or saving. I have also installed no specific driver for this venture but my radio comes up as one of three choices in the CHIRP drop-down. How? I'm not sure but I have a previously installed driver for a USB to serial device for programming my E-flite R/C speed controls. One note though - I am running Snow Leopard on a several year old Macbook Pro.
Some days are diamond, some days are .....
I will report back on the driver identification when I get home from work.

Topic: 4652 Message: 4669

The current process works. It is repeatable. It's just a matter of following the instructions.

It's a whole lot easier than trying to wire up and debug your own DB9 cable, plus deal with another USB/Serial converter that may or may not have the same driver issue.

If someone really wants to make this easier, write a custom installer that puts the right parts in the right places and removes any conflicting driver. The software pieces are out there.

George

Subject: Re: [baofeng_uv5r] scanning memory channels with R-CTCSS

Hi Cap -

Can you report what firmware your UV5R has currently? Thanks.

73,
John AC4JK

On 7/18/2012 10:52 PM, Cap Pennell wrote:

Testing with another radio, I've found that while scanning programmed UV-5R memory channels in channel mode, the scanning does not stop for signals on those memory channels when those memory channels include R-CTCSS (Menu Item 11) settings lower than 141.3 Hz (136.5 Hz and lower). But the memory channel scanning will stop on signals (and the signals will be heard thru the speaker) when those memory channels include R-CTCSS settings of 141.3 Hz and higher (regardless of the actual CTCSS being received on those channels). Eh?

However, programmed R-CTCSS works properly (selectively) in channel mode while _not scanning_ the channels.

So, for the ham repeaters around here which do Transmit a CTCSS (PL) Tone lower than 141.3 Hz which I'd like to include in my UV-5R's memory channel scanning sequence, I've programmed a duplicate set of memory channels, each set with R-CTCSS OFF. Then to SKIP the (twin) memory channels that are programmed with a R-CTCSS lower than 141.3 Hz I've had to use the programming software, but I can still select those memory channels to use for transceiving, one channel at a time. <grin>

73, Cap KE6AFE

P.S. Is there already a "wish-list for the next UV-5R firmware revision" available somewhere?
I'd like the option for backlight on key press ONLY, and R-CTCSS that functions in channel mode scan.

My focus for the baofeng uv5r is to explore options for dependable communications within 100 miles and, from there, extend it as needed.

As well I wanted to investigate the use of NVIS. While falling into the HF range (40-80 meters) it is specifially designed for this geographic reach. I expect a base station will be needed at one end but at the other ... I'm hoping something more mobile may be used. I'll be looking at some inexpensive equipment as well at least for testing it out in my area.

While out-of-scope of the UV5R I was wondering if anyone has played around with NVIS at all?

Us Customs has a hold on the item for some reason, is most likely the cause. I went through the same sort of thing a couple of weeks ago. It should eventually get to you. RadioShop888 (EBAY) has been sending all my orders from them DHL (I get it in 3-4 days normally).

4678. Win98 programming software?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-19 19:20:50 UTC
From: Tony
Topic: 4643 Message: 4678

Hi Group.

Was wondering if there's any programming software out there which will run under Win98? I know that OS went out with the dinosaurs but I have a P1 laptop running DOS/WIN98 for programming the older radios such as the Motorola GM300 etc. That won't run under the newer OS's (I didn't have much success). I suspect its a processor timing issue and Moslo didn't help either :-(

The current software did start under Win98 but ideally wants a resolution of 768 X 1024 and my laptop only does 600 X 800 so
the screens get chopped :-((

Thanks in advance!

Regards.
Tony

WIN 98 could run 32 bit, as well as 16 bit.

Don't know of anyone writing 16 bit software any more.
That should be a bit of a challenge.

George
Please send a link to those instructions and the location of the correct driver as soon as possible
I am sure they will save me a lot of time and frustration
I spent all of last night searching this forum, CHIRP, Baofeng, Woxoun and the internet in general an have not found anything
I am working on a MacBook under OSX 10.7.x (Lion)
And I still think there would be a big advantage to being able to work with a known genuine Prolific chip

Hello All,

Sorry for the noob question, but i could not find an answer using the search.

I'm new to ham and I just recieved my uv-5r from hong kong. I am having problems hearing the repeaters in my area (New Orleans, La). To the best of my knowledge, I have set up the freq, offset, and pl tone correctly, but I must be missing something. I can hear commercial fm stations and the noaa weather (on 162.550), but not the repeaters.

Thanks for your help.

Rich KF5RAC

I would double check the TX and RX frequencies of the repeater. It confused me at first and I had it backwards for programming my radio. Only thing I can think of, other than make sure receive ctcss is off.

Thank you all for your prompt replies. I am trying to access the w5gad repeater (since it is near my house) and the repeater information I found on the www.artscipub.com website. the information given is:

output: 145.470 -
pl: 114.8

I set the top line my my uv-5r display to 145.470 MHz, the offset to - 0.600 MHz, and yes I had the recieve ctcss on. I turned off the receive ctcss and still nothing. I PTT and my lcd glows red and indicates I'm transmitting on 144.870. I announce ID and "testing", still nothing. I am under the assumption that there is supposed to be an automated response that identifies the repater, right?

Thanks,
Rich KF5RAC

Is that repeater always running? According to their website it is in operation on Tuesday night at 9:00. If its not up at other times you wouldn't get a response.

Yes. But what everyone is trying to tell you is to make sure R-CTS (menu #11) is set to off.

A repeater only has to ID every 10 minutes just like you do. If it has done so within the last 10 minutes it might not do so again until its 10 minute window is up.

I read that comment about the net on Tues nights, but I took it as "it is in operation full time, but we concentrate on meeting there on tues nights at 9pm" I may have been reading too much into it, but I also tried their repeaters on 444.000 and 147.240 and met with the same results. I have also tried other repeaters around the greater N.O. area, but that was with my r-ctcss on. I guess I will try other repeaters now that I turned my r-ctcss off.

Thanks,
Rich KF5RAC

Rich:

Are you sure that repeater is on 145.470? I'm not from around there, but their Web site shows it as being on 145.370. I do see that some of the repeater listing sites have it on .470 so perhaps they moved at one time. You might try 145.370 to see if it comes up there.

NK8J:

No, Buddy is right. There is no such requirement imposed by the FCC and the states or local organizations do not have the authority to change that. A coordinating council may try to impose such a requirement for a repeater to be on-line, but they have no authority to force any repeater off the air, even when there's interference. That authority rests solely with the FCC. In a situation where a non-coordinated repeater is interfering with a coordinated repeater, the coordinating body, after working to resolve the issue, can ask that the non-coordinated repeater shut down, but to force that, the issue needs to be brought to the FCC and the FCC might then issue the order for the repeater to be shut down. Of course an interfering repeater owner should know what the outcome would be and try to be compliant with the coordinating body.

Needless to say, it's best for repeaters to be coordinated and repeater owners should realize that in the end they will not win if they are non-coordinated and interfere with a coordinated repeater. However, the coordinating body must also do their job and must provide the means for repeaters to be coordinated where possible. Not doing so jeopardizes the FCC's view of them as a coordinating body.

There's also the matter of what constitutes interference and there's differences between hams as to what that means. For example, it's not interference if a distant repeater is occasionally heard on the output frequency as that would not interfere with the operation of the local repeater. If that was brought to the FCC by a coordinator, they might not be pleased with the result.

Thanks Chuck,

There were comments on the artscipub.com website stating that the repeater was changed from .370 to .470. I'm making an assumption that the information is correct. I guess I'll try listening in on .370 for a while...

Thanks,
Rich KF5RAC

A coordinating council may try to impose such a requirement for a repeater to be on-line, but they have no authority to force any repeater off the air, even when there's interference. That authority rests solely with the FCC. In a situation where a non-coordinated repeater is interfering with a coordinated repeater, the coordinating body, after working to resolve the issue, can ask that the non-coordinated repeater shut down, but to force that, the issue needs to be brought to the FCC and the FCC might then issue the order for the repeater to be shut down. Of course an interfering repeater owner should know what the outcome would be and try to be compliant with the coordinating body.

Needless to say, it's best for repeaters to be coordinated and repeater owners should realize that in the end they will not win if they are non-coordinated and interfere with a coordinated repeater. However, the coordinating body must also do their job and must provide the means for repeaters to be coordinated where possible. Not doing so jeopardizes the FCC's view of them as a coordinating body.

There's also the matter of what constitutes interference and there's differences between hams as to what that means. For example, it's not interference if a distant repeater is occasionally heard on the output frequency as that would not interfere with the operation of the local repeater. If that was brought to the FCC by a coordinator, they might not be pleased with the result.

From: Buddy Brannan <buddy@brannan.name>

> if you run it 24 /7 it must have an ID yes and in some states be coordinated to be in operation.

This is also incorrect. There is no FCC regulation that requires that a repeater be coordinated. Of course, if it isn't coordinated, the uncoordinated repeater bears the brunt of the responsibility for any interference to a coordinated system, but that's as far as the coordination "requirements" go.

I'm finding it difficult to remember all the frequencies in my UV-5R even with alpha tags. Do you have a system for naming the channels that makes them easily recognizable? I thought about using the station call signs, but some have a 2 meter and a 440 frequency under the same listing. What about rarely used frequencies, such as places you travel to from time to time. I go to Nashville, TN., several times a year and there are probably over 10 frequencies just for that area alone.....sorry just rambling at this point. Let me know what you think. Thanks!

I'm curious here too. I might print myself a little spreadsheet just to keep track of what's what. I'm going to be traveling around lake Michigan in a couple months. I'm thinking city names is what I'm shooting for. For multiple repeaters in cities, I generally choose the ones that are skywarn.

I enter the first 60 with call signs and duplicate the second 60 with locations.

so channel 27 is KJ6XYZ and channel 77 the same freq. but alpha tagged PALOMAR.

Then I set the A to show alpha tag and the B to show freq.

It halves the amount of memories available, but I can see freq., call, and location.

If I may ask a somewhat related question, how many characters is the alpha tagging? I can't seem to find the answer anywhere, even in the online manual I found.

Thanks in advance for any information provided.

Hello, I have owned a baofeng uv-5r for about 2 days, and I am happy with it. I have been able to program manually just fine as well as with the cable. My problem is I can't store or make a file to store my input(channels). I go to save, but it will not let me make a file.
THANKS

Mike,
If you are not using all ready, try CHIRP. It lets you create 7-character alpha tags vs. the Baofeng software's 6-character alpha tags. Since USA ham callsigns are usually no longer than 6 characters, you could tack a V or U on the end to indicate VHF and UHF.

Something I read somewhere suggested using Xnnn to identify ham 2-meter simplex channels. For example, X643 would be 146.430MHz, X646 would be 146.460MHz and so on. I have X652C for 146.520MXz to indicate it is the calling channel.

I have the weather radio channels as NOAA1-NOAA7, MURS1-MURS5, FRS1-FRS14, GMRS1-GMRS8

Another thing I do is to set MDF-A to NAME (menu 21) and MDF-B to FREQ (menu 22). That way when I scan the upper display I see the alpha tags. Then when it stops on a channel, I can switch to the lower display and then select the same channel number and see the frequency. This helps on the VHF/UHF repeaters with common callsigns.

The last thing I did was export the channel setup to a CSV file using CHIRP. Then I imported it into a spreadsheet program so I could add additional details.

It's six. However, I believe there is a mod that allows for seven; it involves editing the DAT file created by the programming software.

The HT has room for 7-character alpha tags.

The Baofeng software only lets you save and edit 6-characters alpha tags. It does honor existing 7-character alpha tags.

CHIRP lets you save and edit 7-character alpha tags.

A spreadsheet is a good idea as long as you don't try to read it while driving. I make a file in CHIRP for each location I visit when they are more than 35 miles from each other. For instance, Alliance where I live has 100, 2 and 440 repeaters within that 35 mile circle. When I go to Cleveland, I load that file. When I get home I reload my local file.

I don't believe that the standard programming cable carries the appropriate signals to do over-the-air digital modes. You'll need an interface more like this.

http://www.unifiedmicro.com/sci6.htm

Additional interface designs, kits and ready built units can be found by googling "sound card interface".

I've been thinking about an '"EASY DIGI" Digital Sound Card Interface' available on eBay. The board is assembled and only needs the appropriate cables hooked up to it.

You will also need the appropriate software.

We are "Full Time" RVers so new areas are an issue. I find that there is no substitute for pre-planning.

I have a "Master" set of freqs..... Nat call on V & H the MURS, FRS, weather and so on. These I load into my unit when going to a new area. Then I program the new area and save it using that area's name, say Gettysburg.dat. In that file I may have "HAN-U", "HAN-V", "HAN-U2", where the first 3 or 4 charachters give me a clue. These names I see in my top or "A" portion of the screen and if I need to know I can then push A/B and find that channel's freq in B.

There are several guides that I have found online any there are issues with them agreeing what the freq might be.

Hope this is clear and is of some help.

JL

So impressed with my first that I got a second UV-5R, speaker mic, case & spare battery!

One observation: got bit by the numerous standards for numbering CTCSS channels. They added 71.9 that isn't on my FRS radio, so everything is off by one.

What is Autolock? It seems that if I unlock the keypad, it relocks when I'm not looking. Is that all??

Am I seeing this right . . . If I have TX-AB set for A, my normal communication channel, and I'm in TDR mode, if my B monitored channel is active (like the weather channel), hitting the transmit button doesn't put me back in A. In fact it appears that the receiver is locked on B until it shuts off (which the weather never does).

TIA

You could say put all VHF in the first 64 channels, and UHF in the last 64 channels. Or if you have some non ham freqs you want to listen to then I would go with 00-50 for VHF 51 to 100 for UHF and then 101 to 128 for Misc stuff.

Ok, the easy digi, I'm looking at the board and see spots for hooking up wiring? I think from the two plugs that go into the radio.

Would the two plugs with other end all wires be all that was needed to make it work on the UV-5R?

I've liked the idea of trying digital modes, but most of the interface stuff is more than I can spare. This looks like a more affordable alternative.

I'm going to look into this some more. With the radio and my testing fee plus one of the boards I'm still under the price of some boxes I've seen.

I really do love my LCR

I on't think the turn around time on the receiver (Switching from TX to RX) is fast enough. Maybe someone has measured that on the bench, somewhere on this group.

Thanks Ken (and all others who answered). I was thinking 6, just like my Wouxun, but wanted to be sure. Thanks for the information.

You could build the interface using 4n25 optocoupler and control it using serial port. This is cheap but works.

I dont think psk31 is very common mode for 2m/70cm but it should work(?). I think there are some digital modes that better for fm modulation.

You could try with Digipan software.

There are not numerous standards for tones- some software just allows you to select non standard tones. FYI 71.9 is a standard tone.
Autolock locks the keyboard after 5 seconds or so.
With TDR ON, you can use a Menu function to select A or B as Tx or have the Tx go to the last active channel. You are seeing it go to the last active channel. Can't remember the Menu number and radio is not right here.

4729. A couple of questions

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-20 22:44:24 UTC
From: W4KRR
Topic: 4729 Message: 4729

A couple of questions:

Whether TDR mode is turned on or off, it still shows the same two lines of info/frequencies. Is this normal? Is there a way to only show the active channel? There doesn't seem to be any visual difference whether TDR mode is on or off.

And, could someone explain the function of menu items 35, 36, and 37? They have to do with "Tail Tone". I tried Off and various other settings, and I didn't notice any difference.

Thanks!

Ken, W4KRR

4730. Charger issue

FYI:

When I went to charge my UV-5R for the first time, I noticed the charge light would not come on unless I pressed down on the charger plug where it plugs into the rear of the charge stand. I removed the bottom of the charge stand, and saw that of the three solder tabs that hold the charge jack onto the circuit board, only two of them were soldered. I soldered the third tab, and that solved the problem. Maybe something to check if others are having issues with their charger.

Ken, W4KRR

TDR is my main negative for the UV-5R. My UVD1P has a TDR button that 'kills' the unwanted side.
The active channel is the one with the arrow on the left.

Message 4113 will give you an idea why menu 35, 36 and 37 exist. Check is out.

http://groups.yahoo.com/group/baofeng_uv5r/message/4113

My understanding is that the repeater being used has to be setup to utilize this feature. I know of none in my area so I have all three set to OFF.

If you turn OFF all of the menu items referring to "STE" (squelch tail elimination), the turn-around time will improve to normal. I think the menu items are 35, 36, and 37.

If you want to do digi modes on fm you need to be thinking packet, or slow scan tv and similar, trying to do psk31 on an fm radio is pointless, you have a 31hz wide signal on an fm carrier, its a waste of bandwith if not time.
Try easypal, mmstv or such with a cheap chinese usb sound card interface add on, that should work, but it will take a while to set up your audio in/out knowing the uv5r is not that reliable in terms of settings.

I don't believe that the standard programming cable carries the appropriate signals to do over-the-air digital modes. You'll need an interface more like this.

http://www.unifiedmicro.com/sci6.htm

Additional interface designs, kits and ready built units can be found by googling "sound card interface".

I've been thinking about an '"EASY DIGI" Digital Sound Card Interface' available on eBay. The board is assembled and only needs the appropriate cables hooked up to it.

You will also need the appropriate software.

I've had my uv5r for a few weeks now and I like it. It is my first HT so I don't really have anything to compare it to, but I think I got more than my money's worth. I manually programed in our local repeater with no trouble, but ordered a cable so I could enter the channel names.

I got the cable today, used the driver that came with the cable and the latest daily download of Chirp. I am able to download, modify and upload the memory. The only problem I have is that I am only using a few of he memories and would like to do away with the rest of them. I see that the frequency of mem 22 and up is set to 0.00000 and you don't see those memories, but it won't let me set the frequency to 0.00000. I tried deleting the unused frequencies and that worked, but then I couldn't add them back again.

Could someone please tell me how to handle this problem.

Looks like menu 14 should do it. In the manual it says VOICE ON/OFF, but in the radio you have choice of OFF/ENG/CHI.

Hi Mike,

This is how I have my radio setup. I mix VHF, next to UHF, and vice versa...

I am familiar with CHIRP giving you 7 digits, but I am use to 6 digits, and here's what werks for me. I pretty much know the amateur freqs position 1 thru 10 by freq.

Channel 1 thru 12 are the freqs I use the most. so I label the channel as the frequency as listed below:

On my UV5R i have the "A" side setup as alphatag, and the "B" side setup as freq display; makes it easy for me to reference either way.

CH1 Freq> 145.290 Label> 145290
CH2 Freq> 444.325 Label> 444325
CH3 Freq> 147.380 Label> 147380
CH4 Freq> 145.330 Label> 145330
CH5 Freq> 145.110 Label> 145110
CH6 Freq> 145.825 Label> 145825
CH7 Freq> 444.100 Label> 444100
CH8 Freq> 444.000 Label> 444000
CH9 Freq> 442.750 Label> 442750
CH10 Freq> 147.100 Label> 147100
CH11 Freq> 155.805 Label> RR PD1
CH12 Freq> 154.250 Label> RR FD
CH13 Freq> 153.920 Label> RR CC3
CH14 Freq> 154.950 Label> RR CC4
CH15 Freq> 155.070 Label> RR TAC
CH16 Freq> 155.640 Label> LLPD 1
CH17 Freq> 154.775 Label> LLTAC2
CH18 Freq> 155.430 Label> LLTAC3
~~~
CH98 Freq> 147.200 Label> MTFRNK < This is MountFranklin In El Paso
CH99 Freq> 444.350 Label> NEEAGL < This is Northeast Eagle Nest

Labels RR PD1 = Rio Rancho Police Department CH1.
Labels CC are Car to Car freqs
Labels TAC are Tactical
and so on...

In the case of you traveling to Nashville, TN... This is what I would do:

CH71 Freq> 147.xxx Label> NSH1V or NSH1 V
CH72 Freq> 145.xxx Label> NSH2V or NSH2 V
CH73 Freq> 146.xxx Label> NSH3V or NSH3 V
CH74 Freq> 145.xxx Label> NSH4V or NSH4 V
CH75 Freq> 444.xxx Label> NSH5U or NSH5 U
~~~

CH76 Freq> 443.xxx Label> NSH6U or NSH6 U
CH77 Freq> 147.xxx Label> NSH7V or NSH7 V
etc. etc

I save Channels 60's and 70's for freqs i rarely use as it takes longer to scroll to them (i dont use the keypad entry feature to change channel), from channels 1 thru 10, it is easy to scroll back around to 128, 127, 126, and so on, so i use these channels, for freqs I use as much as 1 thru 10.

Remember...if you label the "A" side with alpha tags, and the "B" side with the actual freq...it is easy to cross reference names with frequencies.

...of course, if you use CHIRP, now you have 1 more digit, for a total of 7 to play with :)

Hope this helps,

Jimmy

Ron,

Click on a channel that you want to delete (the best place to click is probably the grey LOC column). The whole memory row should turn blue. Now tap the [Delete] key. Everything in that row should now be set to its unprogrammed state.

The only problem I have is that I am only using a few of he memories and would like to do away with the rest of them. I see that the frequency of mem 22 and up is set to 0.00000 and you don't see those memories, but it won't let me set the frequency to 0.00000. I tried deleting the unused frequencies and that worked, but then I couldn't add them back again.

I read that you can use CHIRP to create 7 character name tags instead of the max 6 allowerd by the Baofeng software.

Having just done that I found that the radio won't transmit on that channel. It just beeps. Every other channel still works, the only one that won't is the one with a 7 character name: G4ILO-L in case you were wondering. Previously I had it named as G4ILOL and it worked then.

Julian, G4ILO

Just curious Julian, have you tried replacing the hyphen with underscore or space? some software looks for a byte formation convention, and hyphens are not always useable. We deal with such issues in D star radio, where calls to specific repeaters for example, have to occupy eight spaces, so my call to my local repeater would appear
M0HRR C
Where C designates the port i'm accessing, this is just a shot in the dark as i don't know uv5r software protocol.
cheers

Julian,
It sounds to me like you have Duplex set to "OFF". That is the value for TX Inhibit. IF you want simplex, Duplex should be set to "(None)".

Indeed you can use all 7 character spaces when programming the UV-5R with CHIRP.

I just tested renaming one of my channels to "G4ILO-L" using CHIRP version "daily-20120714" (the last one to update support for this radio) and I didn't have a problem transmitting.

Make sure the "Duplex" column is set to "(None)" instead of "Off" when you want to use simplex. "Off" is a new feature for programming channels that you don't want to be able to transmit on.

If anyone else wants to check out CHIRP here's the link:

http://chirp.danplanet.com/

Also, support for the UV-5R is new and not in the official release yet. Here's the specific version you should download:

http://trac.chirp.danplanet.com/chirp_daily/daily-20120714/

Windows users would choose the file called "chirp-daily-20120714-installer.exe"

Double-check all of the other settings for the affected channel... it's possible that one of the other settings was inadvertently changed when you were "in there".

I downloaded using the Baofeng software and the transmit frequency for that channel had been set to blank.

Duplex was set to (None) in CHIRP. (Nothing had changed it.)

When I download from the radio using Baofeng again the 7 character name is truncated to 5 characters (G4ILO). However if I upload after entering the transmit channel frequency but without attempting to correct the name field the radio still displays G4ILO-L and I can now transmit using that channel. I'm going to leave it well alone now!

I'm using a very recent build of CHIRP as the released version does not support the UV-5R. I presume the blanking of the transmit frequency when you edit the name field is a bug in that version of CHIRP. It's a pity CHIRP doesn't display the TX frequency like the Baofeng software does, as without that there was no indication of what the problem was.

My version of CHIRP is daily-20120706. I must have downloaded it when I knew the 5R was coming. I'll try a newer one in case that's where the problem is.

Just to pull it all together then, for anyone having a similar problem, here's a troubleshooting approach:

- start by listening to a transmitter that is known to be on all of the time (a great choice is one of the NOAA weather stations on 162.xxx MHz)
- make sure Receive CTCSS is off
- then try listening for the repeater(s) of interest. You never know when one of these might be off the air or not in use, so try several diffrerent repeaters
- then try transmitting to key up the repeater. Make sure you have the right Transmit CTCSS set (if the repeater requires it). Leave the Receive CTCSS off for now. Double check the transmit offset and make sure you are transmitting on the right frequency.

Julian,
Thanks for reporting back. That's why I keep a copy of the Baofeng software installed. It helps to sort things out if you can look the data in different ways.

I'm currently using CHIRP daily 20120714. I tried to edit an alpha tag by adding a hyphen and CHIRP won't let me enter one. I can add a " " but not a "-".

I then edited an alpha tag with the Baofeng software. It will allow me to enter a "-" in as an alpha tag. But here is where it gets interesting. After uploading to the HT, the "-" in the alpha tag in the software disappears along with the gap it created when it was there. The alpha tag displayed in the HT has the "-" replaced by a " ". Downloading from the HT into CHIRP shows the alpha tag the same as displayed in the HT (" " instead of "-").

I still can figure out how to get a "-" entered into an alpha tag using CHIRP. I went ahead and downgraded CHIRP to 20120706 to be the same as you. That didn't help.

This exercise at least cleared up a mystery for me. I used to upload channels from the Baofeng software and always got an alpha tag in the HT with a space in it. The space didn't show in the software. It drove me nuts. I don't remember how I finally got it 'fixed'. Originally I must have entered the alpha tag into the Baofeng software with a "-" included in the tag.

So apparently the Baofeng software (at least the V12.03.06 version I am using) or the HT strips the "-" from the upload. So should we avoid trying to use a hyphen? I don't know. It sure would be nice to use in some cases. I may experiment some more later.

p10 of the alleged manual suggests that the "S" character on the display means Dual Watch/Reception. In the pic it is the final char of the "LDS" string.

I tested it and it does toggle along with the #7 TDR on/off setting.

It's not really intuitive.

I just looked at my channel setup and I see what you mean. All of my TX inhibited channels are showing (None) instead of OFF because 20120706 didn't have that in the UI yet. Time to go back to the latest CHIRP daily.

4762. Chirp and Baofeng software alpha characters

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-21 15:44:50 UTC
From: W4KRR
Topic: 4762 Message: 4762

I used the Chirp software to allow for 7 alpha tag characters; it worked fine. I thought I read that if I now read the radio with the Baofeng software, it will retain the 7 characters. I tried it, and it truncates the displays back to 6 characters. Is there a workaround for this?

Also, the Chirp software doesn't allow periods "." Or dashes "-", however, the Baofeng software does allow these. What I would like to do is show "146.520" for the channel name instead of "146520". Is there a way to do this? I know, I could just do "146.52" using the Baofeng SW, but there may be other instances where you might want a period or dash in with your 7 characters.

This kind of thing does my head in. My latest version of CHIRP happily lets me edit the names and put hyphens in. It won't let me enter more than 7 characters though. Sure you didn't have trailing space(s) in the name you were editing?

My version of CHIRP doesn't have a problem with hyphens.

Although the Baofeng program only displays 6 characters it doesn't appear to truncate the 7th character so if you upload the file back to the radio the tag still has 7 characters.

Ron,
My guess is that you have unticked the "Show empty" setting at the top of the template. So when you right click on slot 4 and select "Insert row above", channels 4 thru 9 are moved up one slot each (to 5 thru 10) leaving slot 4 empty. Since "Show empty" is disabled, slot 4 disappears (just like it is supposed to). Tick "Show empty" and CHIRP will then show you slot 0, 4 and 11-127. You'll them be able to program any of the empty slots that you wish.

The only problem I have is that I am only using a few of he memories and would like to do away with the rest of them. I see that the frequency of mem 22 and up is set to 0.00000 and you don't see those memories, but it won't let me set the frequency to 0.00000. I tried deleting the unused frequencies and that worked, but then I couldn't add them back again.

I have the latest version of CHIRP running now. No dashes. I can enter them in the edit box OK, but once I press the [Enter] or click in another cell, any periods and/or dashes are removed.

Ken,
I go back and fourth between CHIRP and the Baofeng software all the time. I have "COMCAST" and "PNT2PNT" both programmed as 7-character alpha tags. The Baofeng software does truncate the display of 7th character, but as long a you don't edit it, it knows what the 7th character is and will transfer it back when the parameters are uploaded to the HT.

What version of Chirp are you using that allows hyphens?

Ken, W4KRR

From: baofeng_uv5r@yahoogroups.com [mailto:baofeng_uv5r@yahoogroups.com] On Behalf Of g4ilo

Subject: [baofeng_uv5r] Re: Chirp and Baofeng software alpha characters

My version of CHIRP doesn't have a problem with hyphens.

Although the Baofeng program only displays 6 characters it doesn't appear to truncate the 7th character so if you upload the file back to the radio the tag still has 7 characters.

It appears that if you try to double click a name to edit it in the default view, it won't allow hyphens. However, if you right click on it and choose "Edit" to bring up the edit window, it will let you enter hyphens.

After following two similar threads in this group I have finally learned enough to be able to say that CHIRP does indeed work with periods (.) and hyphens (-). Also $, = and % work as well. Probably many others.

The trick was pointed out to me by Cory in the "7-character tags" thread. You can't add (.) and (-) editing the main spreadsheet cell. What you have to do is right-click on the channel row and then select Edit. Then (.) and (-) are easily added (plus many others). They both upload and display fine in the UV-5R.

You have to be careful when looking at the alpha tags in the Baofeng software though. It truncates the display to 6 characters and any (.) or (-) characters are not shown. So an alpha tag of "ABCDE-F" will display as "ABCDE" in the Baofeng software. But the Baofeng software does keep the alpha tag intact. I did a Meun 28 and deleted the channel from the UV-5R and then uploaded with the Baofeng software and the special alpha tag returned.

Thanks to everyone that contributed to figuring this out.

I realized the fields may be different because I was using the edit window to add a new channel and when I uploaded it to my radio some of the regular letters weren't showing up.

I figured out that the edit window was allowing me to enter lower-case letters which the radio doesn't like. The spreadsheet view automatically converts any lower-case to upper-case and as you've noticed it also removes hyphens and periods. This leads me to believe that the edit window has the bug and not the spreadsheet and the extra characters simply aren't known to be allowed in the code that scrubs what you enter.

Therefore, before the edit window bug gets fixed, we need to figure out exactly what characters will load and display on the radio so that list can be corrected first.

What did you come up with in your experimentation?

Hey Folks,
As you know this is quite an active group and it is a bit of work to keep up.. So if you don’t mind I'm just going to be lazy and ask who seems to be the best UV-5R dealer based on price / delivery speed and has the most recent inventory. I don’t want o wait 3-4 weeks for delivery to find out I have the original shipping FW and paid $15 too much for lol. Also, I see there is a new HiCap battery. Where is that coming from with the best price?

I have loved my UV-3R and have decided that the drop in charger and the Keypad are just something I want. And at the price of these things, one can always use a spare right?

Thanks very much for your time, Any and all thoughts/ input is greatly appreciative.

So impressed with my first that I got a second UV-5R, speaker mic, case & spare battery!

One observation: got bit by the numerous standards for numbering CTCSS channels. They added 71.9 that isn't on my FRS radio, so everything is off by one.

What is Autolock? It seems that if I unlock the keypad, it relocks when I'm not looking. Is that all??

Am I seeing this right . . . If I have TX-AB set for A, my normal communication channel, and I'm in TDR mode, if my B monitored channel is active (like the weather channel), hitting the transmit button doesn't put me back in A. In fact it appears that the receiver is locked on B until it shuts off (which the weather never does).

TIA

Read message 4371 from "baofengdealer". He appears to be affiliated with Nichone.

http://groups.yahoo.com/group/baofeng_uv5r/message/4371

Maybe you could PM him with additional questions.

Another option would be to talk to the folks at Import Communications
http://importcommunications.com/

Disclaimer: I have no relationship with Nichone or Import Communications. I have not purchased anything from either as well (yet).

That is not intentional, it's a bug! The edit box just isn't doing the
"valid characters" check, and it should be.

Please open a bug for this on the site and I will:

1. Fix the edit dialog so that it does the check properly
2. Add these new characters to the list of valid ones for the UV-5R
driver.

> My guess is that you have unticked the "Show empty" setting at the top of the template. So when you right click on slot 4 and select "Insert row above", channels 4 thru 9 are moved up one slot each (to 5 thru 10) leaving slot 4 empty. Since "Show empty" is disabled, slot 4 disappears (just like it is supposed to). Tick "Show empty" and CHIRP will then show you slot 0, 4 and 11-127. You'll them be able to program any of the empty slots that you wish.

4786. Mag mount antenna

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: Louis Fiore
Topic: 4745 Message: 4786

Hi All,

First of all, thanks to those of you who helped me with programming. Between making sure the radio connector was seated properly and simply rebooting my computer, all is well. I especially enjoy the Query Data Source option in Chrip. It certainly is a help as I travel.

I am looking for a mag mount antenna for my UV-5R. I see many on ebay and at www.radioshop888.com <http://www.radioshop888.com/> . Has anyone any experience with any of these?

73, Lou W2LTF

73, Lou W2LTF

Just my two cents but I think it's better to buy a sma-bnc connector and use a well known bnc 2m/70cm mobile antenna.

I bought a few month ago a 19US$ chinese mag mount antenna for my UV-3R and a few weeks after, the antenna broke when I unmonted it from my car....

Now with my UV-5R, I have a diamond mag mobile antenna and use a sma to bnc to connect it.

Nice Dual Band Mag Mount Antenna
http://www.ebay.com/itm/2M-440-Dual-Band-High-Gain-Mobile-Antenna-W-Mag-Mount-UV325MM-/310415334233?pt=US_Radio_Comm_Antennas&hash=item4846321b59
I would replace the PL-259 connector with a BNC and then use an SMA Female to BNC Female adapter like this one-

Hi Lou -

Over the years, I've found that the most flexible arrangement is to use a "NMO-style" connector for your VHF/UHF antennas, whether permanently mounted or magnetic. The NMO mount, originally pioneered by Motorola, is strong and low-profile. Nearly all of the mainstream antennas are available with an NMO option and, as such, you will be able to easily change antennas as your needs might change in the future.

As to your choice of antenna, that will depend on your frequencies of interest, range, and aesthetic requirements. Generally. of course, the more metal - the better the range.

73 and Good Hunting,
John AC4JK

I second NMO mounting. It's a little work, but you're left with a permanent mounting point, coax run where you need it and out of site. I went with a tram 1180 dual band antenna NMO mounted into my Saturn Vue. Sure, you're drilling a hole, but you're not going to have your antenna moving.

I just won my hi cap battery on eBay for $20.50. According to tracking its sitting at my local post office for Monday delivery. So I'm looking at 7 day delivery from China after purchase, assuming it shows Monday. Seller was radioshop888.(I've bought from them, no affiliation. I do sell on eBay, just stuff I find cheap and flip)

Trick to buying cheap on auctions is time of auction end. I try to get my auctions ending Friday nights or during decent waking hours on the weekend. The battery I bid on ended last Monday at 9:30. Not much competition. Bidding started at 19.90. YMMV.

Good luck and 73

Thanks Alek,
Nice price on the battery. It amazes me how some oif these China Dealers can get it to you in a matter of 5-07 days and yet some are still 3 weeks. And they are the same price point (plus or minus a few cents)

If they'd only realize that we are big kids and waiting 21 days or so is a HUGE HUGE turn off,unless the price is insanely different.

4795. Does CHIRP upload menu settings in addition to memory locations?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-22 21:56:32 UTC
From: charlie_fairchild
Topic: 4795 Message: 4795

When CHIRP uploads a clone image to radio, does it include data related to menu settings in addition to frequencies that get stored in memory? The reason I ask is that I have 2 UV-5Rs, and I'm trying to determine if I need to manually change menu settings (such as TDR-AB) on both radios or if I can take an image from one and copy it to the other. My goal is to have both radios configured identically.

Thanks!

That works for me- settings are uploaded to the software and then down loaded to second radio.

I took my UV-5R along during a week of disaster relief work. It was imperative to remain in communication with the EOC due to flash flood risk.

There was no to minimal cell phone coverage, and even though the mobile rig was used extensively the HT was on and monitoring about 14 hours each day. The 3.6 battery lasted from Sunday to mid-Friday without recharge and I even used the flashlight several times. I did take an Icom radio with me, just in case, but never needed to pull it out.

Many of the other hams were impressed that my $60 radio worked just as well as their more expensive Icoms, Yaesus, or Kenwoods. It was also nice to have one-touch access to NOAA wx and FM broadcast.

Awesome that the UV-5R performed well, hope things are better where you were. Hopefully this radio and others in this affordable price range can help people (previously non radio people) prepare better for future events. And thank you for using ham radio in its service capacity.

Lou, I bought one of these from RadioShop888 two years ago:
http://www.radioshop888.com/radioshop_product.php?id=102591

When I first saw it I was disappointed at how small the magnet was but wow - it is very strong!

Performance is very good. I used it daily for a couple of weeks during a holiday in Queensland, Australia. Then on and off mobile at home. Eventually the performance dropped way down - I believe it is from the many times a had to close a door on the coax. The antenna did not rust or degrade visibly in any way, and is very flexible. For the price it is worth it.

Steve, that is an interesting report. I bought one of those several years ago and found it gave me poorer performance than a hand held antenna inside the car. I noticed it in a box when I was looking for something else on the weekend, maybe I bought a dud or it is time to give it another try.

Cheers,

Tracy VK3FTSR

> Performance is very good. I used it daily for a couple of weeks during a holiday in Queensland, Australia. Then on and off mobile at home. Eventually the performance dropped way down - I believe it is from the many times a had to close a door on the coax. The antenna did not rust or degrade visibly in any way, and is very flexible. For the price it is worth it.

I just received two UV-5R's with the programming software and USB cable. However, after downloading (after 4 attempts), my computer could not find the proper com port. I went to youtube and followed the instructions step by step, yet.....nothing !
Has anyone had this problem ? and if so, what was the remedy ?

I bought one too and it had intermittent poor performance. I found the centre conductor of the coax was poorly terminated in the mount. Fixed that and it worked fine after that. You have to remove the magnet to repair it and that takes a bit of effort as it's very strong. The coax connections are just clamped so not the most reliable. It does make it possible to repair though!

Also, a good guide, "Cables, Prolific PL2303 Drivers, and Windows 7.pdf", is available in the "Programming cable and drivers" folder of this group's files area.

Keith,

I started with one and after I and a couple of friends were so impressed with it, I made another order and I now have three myself and the others were distributed among my other ham friends. I believe in back-ups and redundancy and for the cost I am thinking of ordering another.
I also got the extended batteries, speaker-mic, and extra programming cables. Neither I or my friends have had any problem with these radios or the extras that go with them.

I buy from radio888 all the time and they ship my stuff DHL most of the time (3-7 days). I asked them to ship it
that way and said I would pay the difference but they say most of the time the shipping cost the same.

So far I have ordered 8 UV5Rs an SMP908 (very happy with it) various antennas and other misc. stuff from them.

I just won my hi cap battery on eBay for $20.50. According to tracking its sitting at my local post office for Monday delivery. So I'm looking at 7 day delivery from China after purchase, assuming it shows Monday. Seller was radioshop888.(I've bought from them, no affiliation. I do sell on eBay, just stuff I find cheap and flip)

Trick to buying cheap on auctions is time of auction end. I try to get my auctions ending Friday nights or during decent waking hours on the weekend. The battery I bid on ended last Monday at 9:30. Not much competition. Bidding started at 19.90. YMMV.

Good luck and 73

I bought mine at Dayton this year just for the heel of it. Import Communications sold it to me along with an extra battery and the programming cable. They sent me to their website for the Baofung program. I had the whole thing up and running that night at the motel. No problems. A dandy little rig. Not as good as my FT-60 (also made in China) but 1/3 the price.

Here's something I just found in the Norton Antivirus log file.

baofeng%20pc%20software%201.10%20english%20portable[1].exe
Threat: Suspicious.Cloud.7.EP

This program was flagged as a "High Risk" and was quarantined. It was downloaded from "http://f1.grp.yahoofs.com/v1/M0drT9hK.... (where the rest of the URL was a long string of random characters).

It was downloaded on May 22 2012.

"Detection of threat based on malware heuristics."

The adjective "heuristic" means using experience to learn and improve. So when certain characteristics show up (probably character strings in this case) suspicion is raised. It's sort of like being more careful when you see a person talking on his/her cellphone while driving... no real evidence, but I'm inclined to watch for problems.

I expect in this case it probably means nothing other than something in the code is similar to malware perhaps written by a Chinese programmer. And since many of us use this very copy of this software with no apparent problems, I expect the Norton warning can be safely ignored.

It looks like it might be bad, so we claim it is. But we have no proof,
nor for that mater any thing except a guess.

The file seems to be gone from Yahoo too.

Geoff.

Over the years I had a lot of problems with Norton reporting false positives. That is probably the case here. Just ignore it.
Had so much trouble with Norton that I removed it from all PCs that I was responsible for several years ago. I now use free version of AVG with no problems.

Note that Norton comes on a lot of new computers as OEM software. Once you install Norton, it can be a problem to get it off your computer. A simple remove program doesn't always work. If you desire to remove Norton, search internet for Norton Removal Tools to get it completely off your machine.

The message Suspicious.Cloud.7.EP does not point to a specific virus, but just indicates that the file has not been cleared by Norton's Antivirus Database.

Has anybody ever returned a UV-5R to 409shop and if so how long did it take to get you

Repaired radio or new radio back.

Mine quit turning ON and I had to send it back for repair/replacement and was just wondering what the turn-around time might be.

Thanks in advance

My computers are used for my business and I wouldn't settle for anything less than Norton Antivirus. The Baofeng cloaning software runs fine on this copmputer and aparently what ever Norton detected, it's an appication that runs in the background. It's spyware that I don't want on any of the 4 PC's that I have networked for my Business.

Topic: 4518 Message: 4820

For a base antenna - Google Copper Cactus J-Pole. You can make one for about $15 out of a 10' length of hardware store copper water pipe and a trip to Radio Shack for the connector. Or you can order one for about $30 from various sources online. It requires no ground plane, has excellent horizontal propagation, and work very efficiently with the HT's. You can also do a ladder wire j-pole with the same characteristics that you could simply hang in a window.

http://www.pcacs.org/j-pole_designs.htm
http://www.2wayelectronix.com/ (Where I got mine. Works amazingly well)
http://home.comcast.net/~buck0/ll_coolj.html
<http://home.comcast.net/%7Ebuck0/ll_coolj.html>
http://www.hamuniverse.com/2mladjpole.html

Cheers & 73's

Jim,
Thanx for the right-click Edit find. I was trying to enter
M9-Call as a tag. It takes the hyphen, and lower case, but the lower case letters don't display on the radio. Is it the consensus that "no lower case" is a radio issue?

I just received UV-3R and UV-5R programming cables from "radioshop888" on eBay. I had a different experience from others here.

I simply plugged in the cables and my computer found drivers and voila! Ready to rock.

I first tried the Baofeng software with each radio and yes, had to find the correct Comport. I simply looked in Device Manager, which listed the device and which port it was connected to. I didn't need a port finder program.

Once I set the port in the Baofeng software I read the radios, made a few changes that I wanted, and on the UV-5R I added alphanumeric labels. Then I wrote back to the radios.

Bada-bing, Bada-boom, done. And I saved the data files for future reference.

All in about 15-20 minutes, with typing in the channel labels taking most of the time.

No Prolific driver problems.

I then tried CHIRP, which worked with both radios. It was no easier to use than the Baofeng software.

So, I had no problems. Easy!

I also received the high capacity batteries from radioshop888. Really fit and look like part of the radio, and a nice balance. Very nice.

I got mine here for under 7 bucks and it works fine with CHIRP. It uses com16 and baofeng software seems to only use com1 - com8 so since it worked with CHIRP, I didn't push it.

http://dx.com/p/usb-programming-cable-for-kenwood-wouxun-puxing-quansheng-walkie-talkie-66578

Took about ten days to get here.

It's usually not a seller issue. It's a supplier issue (or some level of a supplier's suppler issue).

In China it is often very difficult to tell where your parts have come from. That's just the way it is with commodity parts like cables.

Greetings,

I have been trying to save commercial FM stations into my Baofeng UV5-R without success. Chirp did not appear to support it, neither did the Baofeng software, and I have not found a way to do it from the radio itself.

Perhaps the radio does not support memory storage in the band 65-108Mhz?

Other than that, I have, with a great deal of fun /amusement mastered the beast. Nice little radio.

Anyone figured FM storage?

Regards,

Stan, G4EGH

With today's CHIRP daily, 20120723, you can now enter special characters in the spreadsheet view as well as the right-click|Edit view. It will also allow you to enter lower case letters but don't do it because the the UV-5R won't display them. This will be addressed in a future CHIRP daily. Thanks Dan.

This question has been raised and discussed here in the past. The way I understand the answer it that the commercial FM receiver is handled by a different chip than the walkie-talkie chip. The two chips don't communicate between each other so there is no way to store broadcast FM stations.

That's likely true. I can't see how anyone making a genuine Prolific USB
cable could survive given the number of knock-offs.

Ok. First off, 7 days from bid to my door from China. I'm very impressed.

Down to business. Just turned green on my charger, about 2 hours. Not shabby. The radio is longer, but is still very slim. It only adds 1.5 inches to the length.
Weight with standard battery is 7.5 ounces. Weight with the new battery is 10.2 ounces. I've got an old Motorola Saber and it weighs 1 pound 7 ounces, so not a deal breaker for me.
I remember getting the radio and wondering what was up with the shape of the bottom. This battery is the answer. There is no play in it.

Life? Gonna be a while before I figure that out, the standard already runs forever. Overall I think I made a good choice, holding the radio feels better, like I'm not using a toy. YMMV.

So there's no problem with Prolific drivers, buy a serial cable programming lead and buy a USB to serial cable using the FTDI chips.

One could avoid the Prolific problem entirely by purchasing a serial
programming cable and a FTDI USB/Serial converter.

FTDI chips don't seem to suffer all of the driver issues that crop up
with Prolific and counterfits.

Ron,

This was mentioned by someone a week or so ago so I did a search on eBay for FTDI and I didn't see a USB to serial adapter that was reasonably priced. Most everything seemed to be breadboard style devices. It didn't seem practical to me at the time.

After reading your post today I took another look and this time I did see such a cable for $12. So with it and a 6-004A programming cable a person could have a non-prolific USB to UV-5R programming cable assembly for less then $19. ftdichip.com claims there are drivers from Windows 98 all the way up to Windows 7 64-bit, Linux and Mac OS 8 to Mac OS X. So this does indeed appear to be another acceptable way to interface a computer to a UV-5R.

Is that the HL-UV8R? When I googled UV8R, that is what I found. The info for these radios are confusing. Are they single band or dual band? In one picture of the radio it shows the inside case where the battery would snap on and it lists like 136-174 220-260 400-470 and 420-480. Very confused about this model.

Yep, got 2 at that price.
Can't give you a review on it yet, as the manual programing is a pita.
I can not locate software to program it, not even from the supplier (ahappydeal.com).
My units say it's a tribander. 136-174 MHz, 200-260 MHz, and 400-520 MHz. But I can't verify that yet.
Over all, the quality is as good as the UV-5R.
There is now a Yahoo group dedicated to this radio also.

I think you're making a mountain out of a molehill. I'm running
XP PRO and I just plugged the cable in and it works. I did load
a driver for my RadioShack scanner cable (FTDI) and also one for
a Keyspan serial->USB adapter before I got my HT.

Now if you're running Vista or 7, that may be a different story...

The driver conflicts are with Windows 7 and Vista.
XP doesn't supply driver updates so the existing ones are spot on.
The drivers with XP work perfectly from the start.

I am running Win7 and by using the older driver as noted in prior postings I can use the Baofeng and/or Chirp software without any problems. I did adjust my Com Port to 1 since the BF software did not save that info.

I am able to be-bop between the two software programs and now have a library of area freqs. I am always on the road so I need flexibility and I do have it with this setup.

This LCR with a battery eliminator, speaker/mic and mag antenna is about as portable mobile rig as one can get and it works well as a QRP in a motorhome too!

I mentioned it a few times before here - this radio exists for a long time, and is sold under many names. Slight cosmetic differences were observed between the various brand names.

These are mono-band radios. Unless something improved over the last year or so, these are NOT recommended.

My experience with this radio:

- TX audio muffled
- LCD hard to read
- Battery life disappointing (rated 1500mAh, but actually 1200mAh)
- Charging takes ages
- Parts started to fall off within a month or so
- VCO/VXO locking problems

I also had to buy a pair. They now serve as monitor receivers. I would love to sell them, but I would feel guilty for the rest of my life.

These were my first ever Chinese radios. If I wouldn't have been so persistent and curious, I probably wouldn't have bought another Chinese radio in my life.

I'm rather suspicious about the 7 Watts output, especially when taking the battery capacity into account. Assuming an PA efficiency of 50%, this would mean that about 14 Watts of energy input is needed in order to generate max. output power.

The battery itself can deliver 1.2A * 7.4V = 8.88 Watts (worst case scenario) or 1.5 * 7.4 = 11.1 Watts (best case scenario) during one hour.

That wouldn't be much talk time.... do the math ;)

Why not? Isn't there a 'VHF /UHF'key of V/U menu? If not, you should at least be able to test its range by typing in a frequency on the keypad.

My best guess though is that you're confusing the label on the back, which enables the manufacturer to specify ONE of the possible ranges, with tri-band.

Another way to find out is taking off the antenna and looking at the text on the base. Often the frequency range is printed there.

> Over all, the quality is as good as the UV-5R.

In what way? Please be more specific (sensitivity, selectivity, RX/TX audio, battery life, menu options, DTMF, 1750Hz burst tone, etc etc). At least I can delete 'Support' from the list, as there's appears to be no software for it.

Hans / PD0AC

4866. Re: No TX Audio

Topic: 4860 Message: 4866

Some have had this issue after removing an external mic or the programming cable. My guess is that debris from manufacturing gets in the contacts and keep them closing when the plug is removed. Some have been successful clearing the debris by repeatedly inserting and removing a plug into/from the speaker/mic port while occasionally spraying compressed air (the kind sold in a can and used to clean computers).

I also feel that the factory sometimes does a poor job of removing flash from the inside of the case leaving the internal microphone hole in various degrees of plugged. This would explain some of the low audio reports and why drilling the hole out has sometimes been a successful fix.

A couple of weeks ago I realized that a metal paperclip just fits in the external microphone hole. I gently inserted it into and pushed it through the mic hole with minimal twisting to keep from damaging the mic element. I've not had any low audio reports since doing this.

The mic element is roughly 7/32"(5.6MM) behind the front face of the HT. If you try this and the paperclip meets resistance considerably before this depth, I'd say the passage is blocked. You might be able to clear it with the paperclip. Or a similar sized drill bit might be required.

I also think it is some of this loose flash that gets into the external mic jack contacts and keep them from making contact in a few HTs.

YMMV. Do any of this at your own risk.

Good luck,
JIM KC9HI

Hello to the group.
I mainly use CHIRP, but also have the BF software loaded too.
Wondering if anyone else has this issue with the UV-5R since I have not seen any chatter about it.
I have 100 freqs programmed using CHIRP. 95 are repeater and 5 simplex.
Found that 10 of the 100 had no offset, offset set to 0.0000.
I would change the offset to either 0.6000 or 5.000 accordingly.
Save to the radio. Then download again.
The same 10 just do not want to keep the programming.
I read the radio using the BF software, and confirmed the offsets were not right.
I yet to use the BF software only and recreate the issue.

I'll do some cross checking and maybe narrow down the problem.
Software, Radio or just a quirk somehow.

Anyone see this problem with their programmed list?

Using the software I ignore offset and just program in the TX and RX
manually, if I don't get them imported from chirp.

Since the offset feature frankly baffles me on this radio, especially if
trying to manually program I just ignore that it exists.

Robert,

It is best to program the channels from the software. In the BF software you need to do the math for the offsets, in the Chirp software you need to enter the correct shift using the Duplex drop down menu.

The radio when accessing the menu functions is in current mode, meaning that what you are seeing IS NOT what has been programmed but rather you are in a mode to add information for a NEW channel. Many are confused by this "feature". Because of this I do not think that one can view or edit the contents of a channel.

John

$57.92 including shipping for the tri-band unit. Some inconsistencies in their data (199 channels, or 128 channels?),
but they are claiming 144 / 220 / 440 MHz coverage, and the label does show 7W. Here’s the advert:

http://www.aliexpress.com/store/product/Full-frequency-walkie-talkie-HL-UV8R-small-sized-UV/709139_559696977.html

Haven’t ordered one yet, but toys just keep getting every day.
Time to start monitoring the new UV8R yahoo group (http://groups.yahoo.com/group/UV8R/messages) for the latest news & test results.

A short comment for clarification. Tones can be used to avoid hearing others on the channel but such use is not appropriate. When you use a tone on a simplex channel, you cannot hear if anyone is using the channel and you can talk on top of them- that is interference. Tones do not create a private channel- they just hide other users so you do not hear them but you still create interference if you try to talk at the same time. Tones are useful and intended for use on repeater channels to minimize false keying of the repeater. If you do use tones on simplex channels, you should enable 'Busy Lock' which prevents transmission when the receiver is active and avoids interfering with others.

So a little bit of misleading advertising by a number of PMR446 manufacturers then!
Do i have any other option on the Baofeng to enable a "privacy" type mode then that will prevent others from hearing my transmissions unless they have the exact same settings?

Darren

When you use a tone on a simplex channel, you cannot hear if anyone is using the channel and you can talk on top of them- that is interference. Tones do not create a private channel- they just hide other users so you do not hear them but you still create interference if you try to talk at the same time. Tones are useful and intended for use on repeater channels to minimize false keying of the repeater. If you do use tones on simplex channels, you should enable 'Busy Lock' which prevents transmission when the receiver is active and avoids interfering with others.

Unfortunately there is NO way to prevent others from hearing your transmissions without scrambling (encryption) which I think is not legal in many countries. When you use a tone, it does not preclude others from hearing you- any radio with tone disabled (OFF) will hear you whether you have a tone or not.

OOPS- I should have noted that the UV-5R (this Group's subject) is not a PMR446 radio. There are PMR446 'digital' radios and FM analog versions. The UV-5R is FM analog. Since the PMR446 digital channels are standardized, I am sure they offer no special privacy from other listeners who have digital PMR446 radios.

> have the exact same settings?

(Almost) nothing is private when you are using radios for communications. People who write advertising brochures are not always aware of how radios work. What they write can be very misleading. There is no such thing as "privacy."

Any time you set your radios for what they call "privacy," you are actually setting your radios so that YOU do not have to listen to OTHER users. They can still hear everything you say, if they are within range.

As an example, if you and your friend or family member are at an activity, you could set both radios for ctcss on 146.52 MHz. For example:

R-CTCS 100.0
T-CTCS 100.0

You would NOT hear any other stations on 146.52 unless they used the same tone, but they could hear everything you say.

You could also set both radios for digital coded squelch, for example:

R-DCS D031N
T-DCS D031N

Same thing. You would not have to listen to others, but everyone on that same frequency could hear everything you say.

Bottom line: if it's wireless, there is not guarantee of privacy.

I hope this helps a little with your understanding. And may you enjoy many long years of the fun of ham radio!

From previous exposure (with miniature digital cameras) to Chinese nomenclature, I would be careful not to make the assumption that a sequential increase in model name, initial and/or number necessarily indicates a better quality or higher-specced device - or even a newer version, because this isn't always the case - even from the same ultimate manufacturer, and in many cases, several different manufacturers may be producing to almost identical designs.

As Forrsst Gump once said:

"My momma always said, 'Life was like a box of chocolates. You never know what you're gonna get.'"

regards,

Martyn

This radio ("UV8R") looks like a cheap radio to me... I do not have one, but from the way it is labeled
I was guess it is a single band and you get to choose the band.

I have looked at the design of the UV5R and often wondered why they did not add the 220 band in
it, the controller they use has all three bands?

I am very pleased with my UV5Rs and do not plan to replace them anytime soon. I may get more
spares... getting like the wife, buying stuff because it is a good deal whether I need it or not.

Hi..

The TG-UV2 group had a similar problem with program cables and non-prolific chips causing problems.

They found the newer Prolific software will no longer work with the "counterfeit" chips. The solution was to switch to an earlier driver, before the "detection" was added. Problem solved. Chirp doesn't yet support the TG-UV2, so that wasn't an option.

Can't access that group anymore, as I left it when the decision to buy the UV-5R was made. Should be here sometime this week.

This is a Chinese radio designed originally for the Chinese market. The 220MHz band is available in ITU Region 2 which covers the Americas only. It is not available in Region 1 or 3 (which includes China). If the manufacturers see a big enough market then they will include the band. At this time therefore, there are very few radios including the 220MHz band.

Hey Guys,

I'm in need of a extremely short (stubby) antenna for the UV-5R. I primarily need it for 440 use, but dual-band is fine. The more compact, the better. I need this a.s.a.p.

Thanks for the help!

CHIRP is an Open source application designed to help program many different radios. I personally think it is better and more stable than the Baofeng software. It also has additional features to help find repeater frequencies from all over the country and put the information in a format that can be imported into the radio. The UV5R is only supported in "daily builds" of the software at this time but it is pretty stable. Here is a link to the latest release.

Here is what I would do...

I haven't looked, but I would imagine that what you are looking for is going to be scarce to non-existent with a SMA female connection. So I would get on eBay and limit the auctions to USA auctions only (for quick delivery) and "Buy it now" auctions only. Then I'd search for a stubby UHF antenna that satisfied my requirements. Then I would search for an appropriate adapter to adapt from that antenna's connection to a SMA female connection. My preference would probably be a BNC connection (I've already bought a BNC female to SMA female connector). Then once I found the antenna that I wanted and the necessary adapter, I would purchase them both and start watching the mailbox. ;-)

It should. I assume that either your computer has a serial port connection or you already have a USB to DB9 serial port adapter cable?

Do you really need the RJ12 connection? You can get a cable from a USA seller on eBay for $8.50 shipped if you can do without it.

The quickest way to find out where it is would be to download from the radio again and start to save it. Pay attention to where it wants to save it because the previously saved file should be in the same place.

If that doesn't work, then we will need to know more about your system (what OS and where it is installed would be good to start with).

Here's one on eBay.
Make sure whatever you buy has an SMA-F (female) connector.
http://www.ebay.com/sch/i.html?_trksid=p3902.m570.l1313&_nkw=HH-S518&_sacat=0

A one inch antenna may match your radio to 50 ohms, but don't expect a lot of coverage.

It also has additional features to help find repeater frequencies from all over the country and put the information in a format that can be imported into the radio. The UV5R is only supported in "daily builds" of the software at this time but it is pretty stable. Here is a link to the latest release.

Just for curiosity, I once had a pair of PMR radios (spanish made?) that had a 3 or 4 levels "encryption" function.
They had the standard 8 channels with 38 "tones" and encryption worked on any of them.

You would say something like "ball is red" and someone listening with other equipment would get something like "bill us rod" :)

UPDATE:
Deleting the entry and putting in a fresh entry did the trick. I noticed that when you put in that first number, the offset will change accordingly. Try it next time. type in a 1, backspace then 4.

Got my 3600mA battery yesterday. Like the new size. Not so tiny now.

So I would get on eBay and limit the auctions to USA auctions only (for quick delivery) and "Buy it now" auctions only. Then I'd search for a stubby UHF antenna that satisfied my requirements. Then I would search for an appropriate adapter to adapt from that antenna's connection to a SMA female connection. My preference would probably be a BNC connection (I've already bought a BNC female to SMA female connector). Then once I found the antenna that I wanted and the necessary adapter, I would purchase them both and start watching the mailbox. ;-)

From: rrblackmun
Topic: 4867 Message: 4907

While it may be true that the UV-5R works as described below (and perhaps FRS / GMRS radios as well), it's not the case that other radios, including both commercial radios and ham radios, work this way. CTCSS and DCS codes, do in fact provide 'non interference' (rather than 'privacy').

I have and use a Wouxun KG-UV2D handheld transceiver which requires a correct CTCSS or DCS code to be able to receive transmissions that use that code. This fact explains why some owners of the Wouxuns, and other radios, complain that the scan function on their radio doesn't work as they'd like it to -- the scan stops when it detects a carrier on the specified frequency, but does not consider the receive CTCSS or DCS code, so it stops on a a transmission that it can't receive because the correct CTCSS / DCS code is missing. [If the CTCSS / DCS code wasn't required, then you would hear the transmission.]

I invite you to try this with your UV-5R -- program a channel to receive a known frequency (such as a public service) including the CTCSS / DCS code, and listen to transmissions. Then change the programming to remove the CTCSS / DCS code and listen again.

Dave,

I was going to try to write this myself but I found it written better than I could, hope it is clear.

"Receivers equipped with a CTCSS circuit usually have a switch that selects normal mode or CTCSS mode. When enabled, the CTCSS radio circuit, instead of opening the receive audio for any signal, causes the two-way radio receiver's audio to open only in the presence of the normal RF signal AND the correct sub-audible audio tone (sub-audible meaning that the receiver circuitry can detect it, but is not apparent to the users in the audio output). This is akin to the use of a lock on a door. A carrier squelch or noise squelch receiver not configured with CTCSS has no lock on its door and will let in any signal. A receiver with CTCSS circuitry (and with it enabled) locks out all signals except ones encoded with the correct tone. CTCSS can be regarded as a form of in-band signaling." (Wipedia)

To do what you suggest, the whole signal would have to be enveloped or scrambled which then a code would be required to open it up. Since a receiver without the CTCSS capability can hear AND understand the transmission then it follows that a unit that does not have that function activated would not be affected by the tone. I have no trouble receiving TS activated sytems with my unit's TS off.

I have been in error before.....

John

I find it frustrating that one can not change the parameters of a memory channel in the UV5R... especially the tone frequencies. Many amateur HT's provide a function that can quickly transfer the contents of a memory channel to the VFO. I wonder if this could serve as a workaround for this particular issue?

Has anyone determined if the UV5R can transfer the contents of a memory channel to the VFO and, if so, how is it accomplished?

73,

> I haven't looked, but I would imagine that what you are looking for is going to be scarce to non-existent with a SMA female connection. So I would get on eBay and limit the auctions to USA auctions only (for quick delivery) and "Buy it now" auctions only. Then I'd search for a stubby UHF antenna that satisfied my requirements. Then I would search for an appropriate adapter to adapt from that antenna's connection to a SMA female connection. My preference would probably be a BNC connection (I've already bought a BNC female to SMA female connector). Then once I found the antenna that I wanted and the necessary adapter, I would purchase them both and start watching the mailbox. ;-)

Hmm, I wonder what the "hk" in hkstore stands for?

I have two stubbies similar to that, but they have a BNC connector. I have SMA to BNC adapters permanently fitted to my handies so I can interchange antennas with ease.

The two BNC stubbies both are a good match at close to 145MHz. I checked them with my antenna analyzer and they both have a pretty sharp dip. (Analyzer only goes up to 200MHz so I haven't tried UHF which nobody uses here anyway.)

My attempts to buy an SMA-F stubby has led to the acquisition of several fakes / duds. One alleged Comet antenna has a dip at 168MHz. SWR at 145.000MHz is off the scale. Two others had no SWR dip at all that I could find. If I could have taken them apart I think they would have been solid plastic with no radiating element at all!

I would recommend that you avoid eBay for this and buy a genuine Diamond or Comet antenna from a US-based ham store. However I don't think Japanese makers Diamond or Comet will have a version with the reverse SMA connector used by our Chinese radios. Therefore you will probably have to get a BNC version and an SMA to BNC adapter. eBay is perfectly OK for buying adapters.

The stubbies I have that are a good match perform about as well as the stock antenna, if not better. I can actually open a repeater 70 miles away with it on my UV-5R. The others are no use at all, which probably matches most people's expectation of them. But I'm surprised no-one burns out their PA transistors transmitting into an infinite SWR.

If anyone *does* find an SMA-F stubby on eBay that has a low SWR at 145MHzthen please post the details here. I'd like to get a couple and I'm fed up with buying duds.

Sorry for the ramble, but I've wasted time and money on this.

I have one with Diamond on it too. It's a fake.

http://blog.g4ilo.com/2009/11/fake-diamond.html

If you get one that's a good match on 145MHz (and a poor one a MHz or two on either side, proving it's not just a dummy load) then they do work surprisingly well.

The two that work are unbranded and were advertised as "A-157" and have a BNC mount. I got them a couple of years ago so there is no guarantee that ones you buy now will work as well.

I'm running Windows 7 64-bit and this happened to me back in May with the Baofeng software. I could save my channel setup and I could even load it back into the software fine. But if I would use Windows Explorer and go to the "C:\Program Files (x86)\5R_CPS" folder where the Baofeng program files and .dat setup files were supposed to be, there were no .dat files! Is this what you are experiencing?

If it is, then Microsoft has put your .dat files in what is called a "virtualstore". I discuss this a little bit in message 1910.

http://groups.yahoo.com/group/baofeng_uv5r/message/1910

I don't think there is a way to completly disable the virtualstore feature. My advice is to avoid it altogether by not saving your channel setup files with the program files.

What I did was to create a "UV-5R" folder in my "My Documents" folder and store my Baofeng and CHIRP setup files in it. I have my Baofeng software default to this folder and CHIRP automatically remembers it (+1 for CHIRP).

I hope this solves your mystery.

You can't transfer from VFO to Memory (which would be even more useful) so it stands to reason that you can't transfer from Memory to VFO.

Typically one would open it from inside chirp, rather than directly from the folder. One generally does not have to see the insides of the file in normal use. Sounds like you're double-clicking on the file instead of opening it from chirp:

Chirp | Open

and navigate to the file. In my usage (with the Baofeng and a Kenwood 2m) the file was right where I left it in chirp and no looking around was necessary.

I want to try it at work. The repeater is on top of our building, so distance shouldn't be an issue. I'll also carry the stock duck antenna with me and if the stubby doesn't workout I'll switch them out.

I appologize if this has already been asked, but loaded the Baofeng software, and all the columns show ?? and when I go to the 'pull down' menus, it is so narrow I cannot see the characters to select.
Is there a way to 'widen' the page to be able to read the pull down info, and get rid of the question marks.
Thanks.
John

What version of the software are you running?

The old version and the VIP version come up in Chinese and so the columns are all decorated with ????. I'm doing this from memory, but I believe that if you click on the 2nd tab from the right, the drop-down menu will let you select English and replace ???? with English words. If this is you issue, then you can download the latest version of the Baofeng software from the files area. Look for "UV_5R_P 20120425.rar"

4933. UV-5R Programming Cable. A Techie Question

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-25 16:45:24 UTC
From: k9wg@sbcglobal.net
Topic: 4933 Message: 4933

Ok - I'll admit I am too frugal (cheap) to spend $25 on a cable for a $60 radio. So I decided to make one using a MAX233 RS-232 to TTL converter (as I already had one in the parts box). I made one a few years back for my Icom IC-718 and it works great. It appears from schematics of the UV-5R that there are internal pull-up resistors so I used an open collector buffer between the MAX233 and the radio. I can not get the cable to work. My question is, will the UV-5R directly accept TTL signals? If so I can do away with the OCL buffer and go directly from the MAX233.

Thanks

73 de K9WG

4934. serial programming cable

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-25 17:45:17 UTC
From: unalias2
Topic: 4934 Message: 4934

for those interested, I found this on Ebay. It winds up being about $9.00. I ordered it and it arrived here in three days or so from Hong Kong. go to Ebay and search for "Programming Cable for PX-777 FD268 vev-3288S UV-5R 6-004A". It is a serial interface cable. I use a serial programming cable for my Icom stuff, so I ordered this cable (mostly because it is cheaper than usb) to do the UV5R the same way. The cable states it is correct for the radio. I would like to report that it works, but it looks like my radio got hung up somewhere in customs.

4935. Confused about charger PSUs

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-25 18:12:41 UTC
From: Tore B. Bjoernsen
Topic: 4935 Message: 4935

Hi!

Today I received yet another UV-5R.

The desktop charger is the same, as always, and states DC 10V input, and
DC 8.4V output.

My first UV-5Rs charger psu was marked 8.4V, my second one was marked 10V, and
this newest one is marked 12V.

Maybe the desktop charger works OK over this range of DC input, maybe not?
Anyone have more information on this subject?

73's

http://www.409shop.com/409shop_product.php?id=106518

Yes folks I've bought some real crap in the past and I never expected this one to be any different, but it's turned out to be the best stubby antenna so far !

I even tested it against a genuine Diamond stubby was lent to me.

I've just ordered another one.

Works well on 70cm and pretty good on 2m.

The label on it was printed wrong, so I just removed it and I'm actually very pleased with it's performance versus size - and it's cheap !

Andy

If you are programming with the keyboard, then a good guide to use is the "baofeng-uv5r-eyes-free.rtf" guide in the files area. There are some other guides there as well so you might take a look at them all before you get started.

Just this specific group? Or any of the Yahoo! Groups?

I agree with John. This sounds like some kind of virus/malware issue with your computer and probably not specific to this group.

In addition to a good full-time virus scanner like John suggests, I like to occasionally do an on demand scan with Malwarebytes and SUPERAntiSpyware. Like CCleaner and Adaware, they are compatible with any full-time virus scanner and they both have free versions.

No 'mod' required. You'll need a programming cable and CHIRP, though. Then you'll be able to program all the way up to 512MHz. Since you be using the UV-5R as a scanner, the cable will let you inhibit transmitting on the frequencies that you shouldn't be.

I talked about this a little bit the other day after I received my TYT BCG-F8 charger. Message 4620 if you are interested in reading it. I definitely my recommend the TYT charger for the UV-5R if you want to replace a defective Baofeng charger or want to have an additional charger for another location (work, car, bug-out bag).

If I had an 8.4 volt PSU, I'd probably take the bottom off the charger base and measure the PSU voltage under load. If it measured less than 10 volts, I'd replace it with a 12 volt PSU.

Also, knowing that the charger works fine with a 12 volt PSU (the TYT says 13.8 volts input), I wouldn't be afraid to get the proper power cable and use it in the car.

Old news. It happened on daily development release (i.e. not the official release) and was rectified quickly, complete with "unbricking" instructions.

I just ordered 2 UV-5R radios and the spec says the the high limit is 480MHZ. Will CHIRP let me program in the 482 range and also transmit? Sorry for all the questions I'm new at this.

Thanks

Anthony

Chirp is somewhat easier to use and it's free but you should send Dan a donation..... this quality of software costs $50 and usually only works on one radio.

I use both Baofeng & Chirp, just because I like to.

All things new seem complicated and the lack of written manuals and explanations do not help but I guess we get by.

CHIRP is in active development by a motivated developer, plus it works over a wide variety of radios.

You can't get much better than that.

I made one a few years back for my Icom IC-718 and it works great. It appears from schematics of the UV-5R that there are internal pull-up resistors so I used an open collector buffer between the MAX233 and the radio. I can not get the cable to work. My question is, will the UV-5R directly accept TTL signals? If so I can do away with the OCL buffer and go directly from the MAX233.

I investigated powering the charger from my 13.8V shack supply as the last thing my shack needs is another wall-wart. But it switches off (or at least the LED goes out) above that voltage.

My charger for a UV-5R shipped a couple of weeks ago is spec'd at 12V. (I'd never have tried 13.8V otherwise.)

Hi.
I just bought a UV-5R.
I put the battery on the charger like on instructions but I didnt saw any green light!
I did not paid attention on this and I took the battery after 4 hours and seemed full.
Now on the second charging even after 5 hours the battery seems empty.

As I said before there is no green light on.
Before I put the battery on the "station charger" there is a faded red light and when I put the empty battery the red light quite sharply for half an hour.
Then turns off and there is no other light on after this, even after 5 hours!
The most important thing is that when I turn the UV-5R on the battery seems empty!(only one line).

I am from Greece so we use 220V.
The AC/DC Adapter Writes Model A-88, Input 100-240V and output 12V (However I measured the output 9.84-9.88V).
The "station Charger" writes Input 12V and output 8.4V (however I measured the output 6.25-6.30V).

Another thing is that the central contact of the "station charger" doesnt connect with the electonic board inside.

Does anybody knows what is the fault or any possible solution?
Thank you very much.

Open the charger and check the solder connections particularly on the input connector. I have one that needed re-solder to make good connection.

Quite by accident I have found that if you are in the Channel Mode (say on Ch#10) press Menu and toggle to #27 in the Menu and Menu again, enter 001 and press Menu you will transfer the contents of Channel #10 to Channel #001 except for the Channel Name.

I don't know if this is good or bad but it does happen on my unit (BFB231/12303151/Ver-05) Purchased in April.

I ordered another RED 5R ($47) and it is professing to be the new version with FM radio memories..... not that I care about that but it will be interesting to see if some of the "bugs" have been dealt with.

Keep you posted,

John

4983. Mac OSX Snow Leopard CHIRP UV5R

Greetings,

I have a Mac Mini running 10.6.8. I have just gotten a UV5R (BFB251) and I am trying to get the CHIRP programming package running.

I started this process and then paused for a few days and now I seem to have lost my way.

I have downloaded and installed the basic CHIRP release (0.2.2) package including Python runtime. When I double click on CHIRP it comes up under a Python banner at the top of the screen. The version 0.2.2 does not specifically mention the UV5R but the latest daily build I downloaded today does. But the daily build does not invoke the Python top banner when it is loaded. This may be a missing SW hook somewhere or maybe the daily build does not work with the Mac.

I have a cable but it may be suspect as most are it seems.

If there were instructions from this point on I have lost them somehow.

General questions I have.

Can the cable be used in any USB port on a Mac Mini?

Should the radio be turned on or off? If on What mode? VFO or Channel?

Is there some indication on the radio that it is in programming mode?

Is there a sequence of programming launching, cable connection and power status when attempting to connect the radio?

Is rebooting required to recognize the USB cable?

The error message I get in 0.2.2 CHIRP release states a problem with ACK on the radio side. CHIRP under the radio button does not seem to find the cable on a USB comm port but it lists two other devices neither of which seem to work with the cable.

I have checked a number of sites and not found much detailed info regarding the Mac. Have a lost the site that can answer these questions?

Well I was certainly surprised at it's performance compared to the
rubbish I had before. No stubby will ever beat a full size antenna,
but it's still top of the pack compared to other stubbies.

They are available in both SMA versions too.

Something strange happened. Used CHIRP to read the UV-5R made a couple changes (like I've done several times before) and uploaded. A few hours later, did the same thing. I went to delete and move up a channel, and the area where the data is (spreadsheet look) went white and never came back. It did say at the bottom it sucessfully completed the move of XXX channels. So as a work around I moved it (CTRL + DOWN ARROW) and skipped it when scanning. Tried again this morning, didn't think anything would be different... Same outcome.

Anybody else have this happen?

I reloaded the same version, and even the one previous to that... with same results.

Thanks.
I have allready opened and made avisual check.
The central contact of the battery is not connected with the circuit, right?

With CHIRP you cn go up to 180 mhz. My 2 radios are set up as follows;
136-180 and 400-520 Mhz. TX and RX. Obviously I do NOT practice nor do I recommend TX on any band that you are not licensed for. But for giggles, I did a quick 2 second test on the above range limits.

Is there any way to adjust the display contrast on the UV-5R? My second radio needs an adjustment. Nothing serious but it is different than my first radio.

If I remember correctly, someone said that contact "T" is for a temperature sensor, and it is not used in this particular charger.

OK. So I KNOW I KNOW its a beatin subject. I am trying my hardest not to have to ask. However I am stuck. OK so I couldn't get my computer and my UV5R to talk. sigh.. First was a driver issue. Thru some searching I found he older driver.. My PC now recognizes the USB cable as a prolific. OK that point done..I think.. So now when I try to use the baofeng software I get the damn 8020 msg and then it poofs.(Oh and I get the couldn't read or connection something or ruther also..) OK so some more searching led me to the windows 7 64 bit issue. I tried to open it in compatibility mode. No luck. I uninstalled and re-installed from many different sources thinking I had a bad copy.. OK so now I have given up on it unless someone has an idea. I am running win7. So I tried chirp. Well it dont poof.. it dont have the option for my radio. Thru yet more searching and questions I hear that a version in the daily builds for CHIRP does work. Have you seen the list of daily builds? What version or daily build do I need????
At this point I am beginning to wonder if I shouldn't have just got a CB.. please help I hate the Chicken Band..

The version 0.2.2 does not specifically mention the UV5R but the latest daily build I downloaded today does. But the daily build does not invoke the Python top banner when it is loaded. This may be a missing SW hook somewhere or maybe the daily build does not work with the Mac.

Thanks for the pointer to that message
It didn't come up in my forum search since I was searching for OSX
Unfortunately it will not help me as that is the first driver I tried and it didn't work on my system
At this point I am directing my efforts toward learning something about Linux until they come out with the first update to Mountain Lion then I will upgrade and start the process again

I don't believe there are any other drivers for the Mac.

Only Windows systems have the "poisoned" driver problem.

Lots of people are running CHIRP on Mac without issues.

There is a chirp_users group...perhaps you should ask there.

Topic: 4978 Message: 5021

Giovanni,
Was your 9.84-9.88V measured on the plug end of the power supply unit without a load or from inside the charger while a battery was charging? I did it both ways and my voltage was 12.17V no load and 12.05V with a load (I was surprised that it was that small of a drop). The regulated output to the battery was 8.6V. My center terminal was also not connected.

As others have already explained, many have experienced unsoldered wires and cold solder joints inside the charger base. You haven't indicated any problems with that except for the center terminal and apparently that is normal.

A 6.25-6.30V output to the battery is definitely a problem. If this voltage isn't greater than the battery voltage (which is 7.4V) the battery won't charge. So the question is which is defective, the charger base or the power supply unit?

If you haven't already done it, the first thing I would do is measure the power supply voltage while attempting to charge the battery. If it is lower than 8.4V, then I would suspect the power supply unit as being defective. You might be able to get it replace under warranty but it could be cheaper to just buy one outright. The replacement 12V power supply unit for 110V is $6.50 (USD) shipped from 409shop.

If I can find a 7V power supply in my bin of power supplies, I'll try it out to see how the charger behaves with a low voltage.

If the power supply unit voltage under load is still around 9V, I still wouldn't suspect the charger base as defective. I'd try to find some way to feed it 10-12V to see if that makes it work properly. If it works OK with the higher voltage, the the replacement option above would probably fix it.

If it ends up being a defective charger base, then I don't hesitate recommending that you replace it with a TYT BCG-F8. It is amazing to me how much better the UV-5R fits it. It's even cheaper than the OEM Baofeng charger ($13.50 shipped from 409shop and also includes the power supply unit above).

Good luck,
Jim KC9HI

I have been trying to find out if it is possible to program two sets of frequencies in a & b???? When I do my program which works fine with CHIRP or manually I dont see a way to have seperate banks.....

Congratulations on earning your license!

Someone else mentioned simplex. One good idea is to program a memory channel with 146.520 simplex. This is the so-called National Simplex Frequency. You may find people monitoring this frequency while traveling.

But you asked about repeaters. Generally speaking, you need to know the repeater OUTPUT frequency

for example: 146.640

for most repeaters, you can tell that the input would be MINUS 600

for this repeater: 146.04

Some repeaters are upside down

for example: 147.390

so the input is 147.990, which is PLUS 600 kHz.

For the 440 band, the OUTPUT might be 443.750 or 448.750

If it's 443.750, then the OFFSET is PLUS 5.000 MHz.
If it's 448.750, then the OFFSET is MINUS 5.000 MHz.

Most radios know what the offset direction and spacing is; the BaoFeng needs to be told.

Next: if the repeater requires TONE, often called "PL" because that's what Motorola calls it, then you need to know what that tone is. In some cases, it's referred to generically as ctcss, continuous tone-coded squelch system. I prefer to use the generic.

If the repeater uses 103.5 ctcss, then you must program T-CTCS into the BaoFeng. Every time you transmit, the radio will transmit on the proper frequency and with the proper tone. You should be able to activate the repeater.

Another repeater may require 79.7, so you would program that TONE into your memory channel for that particular frequency.

Lastly, now that you're in ham radio it's proper to say "73." Seven three or Seventy-three. There is no "S" at the end of it. Just plain 73.

Does this help get you started? If not, please advise.

If so, you can go to http://www.accesscom.com/~dave6592/usertips.html for some more helpful information.

This was sent to my email and I was drawn to respond.
Amateur radio Is a vast hobby and as such you have a choice to live
in a CB world whereby you really do pretty much nothing technical expect turn the rig on off and select your channels, that's about it.
Or you can use that great God mind given of yours and use the technical aspects of ham radio. You see, you can purchase a 2 meter 440 band radio that is much easier to program but at far greater cost and you will most likely find your more expensive rig much easier to deal with. But mean while that very wise brain will just go to sleep.

5032. Disable PTT when using speaker mic?

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-27 03:11:47 UTC
From: aggieoutlaw
Topic: 5032 Message: 5032

I plan on putting my UV5R in a holster or on my backpack and I don't want to accidentally key the mic when my speaker mic is connected.

Is it possible to disable the PTT button when using a speaker mic?

If not, does anyone have any tips?

Thanks,
Brad

Brad,

I would fashion a hard protector around the PTT button. Odd that when you plug in the spkr/mic that the spearker is disabled but not the mic ??

I guess that's why they sell us these cheap radios.......... we find the bugs.......... they fix them...... and then sell 'em for more !

John

Thank you all for your help. Problem solved. It seems that once I had my unit set right, the repeaters I was trying were not on the air (Doh!). Once I keyed up on an active repeater, I recieved a CW ID. I then made my first contact.

Thanks again,
Rich KF5RAC

Hey Rich,

For me this has been a great experience. I thought I knew which end was up and then this LCR came out and I had to learn and interpret Chinese inside out language, different "features", real features for other bands and I know not what else but for 3 months it has been very, very interesting and quite a bit of fun too !

Enjoy.

It may seem a little drastic, but for 7 or 8 bucks on eBay you could pick up a "2nd" speaker/mic, take it apart, and physically remove the PTT plastic itself. But you're "going in", perhaps a lockout slide switch in series with it wouldn't be so hard? Depends on your tech skills and ambition for this,...
Just an initial thought. Probably not the best one you'll get either.

Seems to me that the UV-3R+ does away with the best features of the UV-3R: the ability to charge from USB and buy cheap batteries. Seems like a step backwards to me unless you just prefer the 5-style case.

From a technical point of view:

The UV-3R+ isn't really interesting when compared to the UV-5R, unless you really really want something very small.

The UV-3R had some problems from the beginning, and none of these were really solved in all the subsequent versions. One of them is the lowest audio level, which is very loud, and a major problem is the poor, sometimes non-existent harmonic suppression.

Some modifications float around the Internet though. Due to the small size of the components, these are not for the faint-hearted.

In general the UV-5R is off the scale when it comes to price/performance. The problems found in the UV-3R are not present in this model. There are still some rough edges to deal with, but none of them are major.

The Wouxun KG-UVD1P is still the best Chinese HT you can get. However, you can buy at least 2 UV-5R's for that money and still save some bucks for a spare battery...

I agree with that comment. I have two UV-3Rs, and chose the "Mark II" over the Plus for those reasons. Batteries are small and cheap, and I can carry an extra 1 or 2 easily in my pocket when I'm out and about with the tiny 3R. The other one has a permanent home in my wife's vehicle, which we use whenever we go somewhere together, just so I'll always have a radio.
Having said that, I didn't know about the UV-5R when I bought the 2nd 3R. If I had to do it over again, I'd make the one for her car a UV-5R. The incremental cost is under 10 bucks, and for that you get over twice the power, a full keypad, alpha tags, and a host of other features. The only reason to choose the 3R in my opinion is the ultra-compact profile. If your local repeater is "dead close" and you like a radio you can keep in a shirt pocket, the 3R fits that bill. Otherwise, the 5R is far more capable and imho a better deal overall.
If you're thinking of a Wouxun KG-UVD1P, there's a bit of a gap in dollars there. I don't have one of those so I won't comment on it, but there's a nice radio in-between the UV-5R and the Wouxun, at about the $83 mark last time I looked. Check out the Quansheng TG-UV2. I love mine. It's the radio I'll grab when the [catastrophe of your choice] starts.
Lots of LCRs to choose from,... :)Ian

Agreed, the Quansheng TG-UV2 is absolutely great and often forgotten. One of the few Chinese hand-helds with a decent receiver, which doesn't collapse when connected to an outdoor antenna.

Not to mention the second-to-none battery life...

Thank you Jim and all the rest for helping and for all these details.
I reoppened the power supply unit and I took off a big piece of solder I saw the first time. I dont know if was from this but now I have a little more current.
Still however I cant use the charger.

Now the voltages are these:
WITHOUT LOAD: 10.50V output of the power supply unit and when I hook up with the charger station , the output at the contacts is 6.63 V.

When I put the battery on the charger station (I have charged it with a charger I have for rc models) the output is 8.06V.

I hook upt a crap power supply (12V 800mA) I have at the charger unit
and this time the red light was bright.

So probably the fault is at the power supply like you suggested.
The shop offered me to sent me a new charger.
We will see.
Thank you again for all this help.

By the way is there a green light? I havent see yet anything green!

Thank you Jim and all the rest for helping and for all these details.

I reoppened the power supply unit and I took off a big piece of solder I saw the first time. I dont know if was from this but now I have a little more current.

Still however I cant use the charger.

Now the voltages are these:

WITHOUT LOAD: 10.50V output of the power supply unit and when I hook up with the charger station , the output at the contacts is 6.63 V.

When I put the battery on the charger station (I have charged it with a charger I have for rc models) the output is 8.06V.

I hook upt a crap power supply (12V 800mA) I have at the charger unit

and this time the red light was bright.

So probably the fault is at the power supply like you suggested.

The shop offered me to sent me a new charger.

We will see.

Thank you again for all this help.

By the way is there a green light? I havent see yet anything green!

The HT PTT is automatically disabled when you insert the spk-mic jacks.

From: Nuno Xavier
Topic: 5032 Message: 5045

Also Disable FM reception (via software) in case FM Key is pressed accidently.

Use keypad lock button or auto lock (via menu).

And also program the radio so that it stays listening to the freq you want and doesn't jump to A line when you want it on B, or vice versa. Best to Disable dual watch

Hope this helps.

Topic: 5032 Message: 5047

Hi people, I finally got my HT last week, and up until now I learned how to fiddle with it and today I made some serious measurements that I want to share.
My LCR is Ver. BFB251 with 1203211 / Ver-05.
Battery fully charged.
VHF test frequency is 150MHz.UHF test frequency is 450MHz.
Measured VHF LOW power is 1.56WMeasured VHF HI power is 4.2WMeasured UHF LOW power is 1.26WMeasured UHF HI power is 4.91W
Squelch measurements on same test frequencies with a 5KHz bandwidth, 1Khz tone modulation.
Minimum sensing carrier was at -134.6dBm. (I could clearly distinguish the 1KHz tone when switching modulation on and off on my generator)Also noticed a 0.9dBm squelch hysteresis.
UHF:Squelch level signal level0 opened all the time 1 -128.0 dBm2 -126.7 dBm 3 -125.8 dBm4 -124.9 dBm5 -123.7 dBm6 -122.8 dBm7 -121.9 dBm8 -120.9 dBm9 -119.8 dBm
VHF:Squelch level signal level0 opened all the time 1 -127.5 dBm2 -127.2 dBm 3 -126.9 dBm4 -127.0 dBm5 -127.2 dBm6 -127.1 dBm7 -127.1 dBm8 -127.0 dBm9 -127.3 dBm
If I can find the time, tomorrow I will perform adjacent channel interference measurements.
So sorry I am not allowed to say anything about the equipment I used.
Cheers!

Hey folks, I'm new to the group.

I've been looking for sometime for a small, cheap, 2m/440 handheld and ran across this particular radio.

I have some questions that I'm pretty sure that you all could answer.

1) Do "they" make a "AA" battery pack for this radio?

2) I found one on Amazon.com where the radio & USB programming cable come as a package "deal" for $65.00 (Free S&H). This "sounds" like a good deal, but does the programming software come with it, or do you have to search the internet for it?

3) Can this radio plug directly into the Accessory port (cigarette lighter jack) of a 12-vdc vehicle? I have a couple of solar panels that produce approximately 13.8 Vdc and it would be nice to be able to charge it that way as well.

4) Does it work well when connected to an external antenna? For backpacking purposes I'd use a roll-up Twin-Lead J-Pole.

5) How about audio quality? I see that it can receive the FM broadcast band as well. Would be nice to have decent audio quality.

Convince me that THIS is the radio to buy!

Thanks!

Rod

> 1) Do "they" make a "AA" battery pack for this radio?
>
*** I haven't seen one for this radio yet

> 2) I found one on Amazon.com where the radio & USB programming cable come as a package "deal" for $65.00 (Free S&H). This "sounds" like a good deal, but does the programming software come with it, or do you have to search the internet for it?
>
*** The software is available free of charge from links on this group. Most seem to prefer CHIRP to the official Baofeng version

> 3) Can this radio plug directly into the Accessory port (cigarette lighter jack) of a 12-vdc vehicle? I have a couple of solar panels that produce approximately 13.8 Vdc and it would be nice to be able to charge it that way as well.

*** not as it comes, but there is a battery eliminator accessory that replaces the battery to allow this (wouldn't help with your charging though!) there is also a double-capacity battery available.
>
> 4) Does it work well when connected to an external antenna? For backpacking purposes I'd use a roll-up Twin-Lead J-Pole.
>
*** There are probably mixed experiences with this - it will depend on the quality of the antenna as much as anything. Mine works fairly well with a cheap chinese mag-mount. Note that the radio has a SMA male connector, so the antenna will need a SMA female, or a converter.

> 5) How about audio quality? I see that it can receive the FM broadcast band as well. Would be nice to have decent audio quality.
>

*** The FM broadcast station receiver is okay - Mono only, of course, and not exactly Hi-Fi! TXC/RX audio is of mixed quality and rather quiet - (there is a mod (drill out the mic hole) which is said to partly resolve this, but I've not tried it myself) not the best, but adequate, and this is a very cheap TRX!

> Convince me that THIS is the radio to buy!
>
*** It's very cheap - and to my mind very good value. If it doesn't do it for you, you haven't lost much :)

Topic: 5032 Message: 5052

I tried this with my UV-5R and I can TX using the HT's PTT with either my speaker mic or programming cable plugged into the speaker mic socket.

Brad,
Here is my suggestion...

If you are going to be monitoring a single frequency, you could setup channel 70 as your RX/TX channel. Then setup channel 71 as your RX only channel (using the TX Inhibit feature of CHIRP or leaving the TX Frequency blank with the Baofeng softeare). Then when in Channel Mode you could set the upper display to channel 71 (RX only) and the lower display to channel 70 (RX/TX). That way you could have the HT set to the upper display when 'holstered' and it won't be able to transmit. When you wish to transmit, you'll just press the A/B key to select the lower display which would also enable transmit.

You could do a similar thing if you were going to have the HT scanning while 'holstered'. Setup an RX only channel for every RX/TX channel you would want to use. Set the RX only channels to have scan enabled and set the RX/TX channels to have scan disabled. Then as before, scan the upper display knowing that TX is disabled and switch to the lower display to transmit.

This does require that you have a programming cable and use the CHIRP and/or Baofeng software to create RX only channels and set then to set the RX/TX channels to be skipped when scanning. So if you aren't already setup to program with your computer, both programs are free and a USB programming cable can be had for under $7.

Rod,

Best shop on Ebay for best prices.
Find one that includes a speaker/mic, for just a few dollars more.
Or find one that includes 12 Volt adapter that replaces battery on back. This will allow you to plug into power port in your vehical, or what you have on your solar panel charge controller.
This radio has the reverse SMA connector. You can find mag mount antenna that will be handy for your backpacking. Check into replacing stock antenna with 1/4 wave flex whip. These are modestly priced, and will help extend xmit range and listening.
I have not yet seen battery pack for these units yet.

I will be buying several of these units for emergencies. My fellow Hams have bought these and really do like them.

Good luck.

Rod,

I have the battery eliminator and it works well both in my motorhome as we stop and in the car. The standard battery lasts several days in rec. mode and not as much TX mode as one would assume. Extra battery size is avail (3600mah), probably better off with 2nd battery.

I use a flex J-pole also and it gets out TX 35-40 miles to repeaters and RX a little further. All makes for a neat QRP station.

I just ordered my 2nd (red this time) 5R, can't immagine life without one.

Julian,

Thanks for you post. I've been wanting to know if I could charge a UV-5R battery in the car using the charging base and the appropriate cable. I've always thought I could do it but I just never got around to seeing if it would work. Today I did the testing and here are my results.

For testing I used a 13.8V 12AMP bench-top power supply, a power cable with a 12V accessory (cigarette lighter) plug on one end and a barrel connector on the other, a pair of black & red clip leads, a digital volt meter and my Baofeng charger base.

My first testing was done indoors. I powered up my bench-top power supply and measured the output to be 13.2V. I then used the clip leads to connect the accessory plug to the power supply. I then remeasured the output at the barrel connector (mainly to make sure I didn't connect the accessory plug to the power supply backwards) and it read the same 13.2V. I then plugged the barrel connector into the charger base and instantly got the solid green with pulsing red LED indicating that the base was currently unoccupied and ready to charge something. I then inserted my battery and the LED changed to solid red as expected.

I then moved out to the car. With the engine off, the accessory plug plugged in and the ignition key turned to the accessory position, I measured the voltage at 12.5V. I then started the engine and measured the voltage at 14.1V. So now with the engine off I plugged the power cable into the charger base and got the solid green with pulsing red LED indication. Repeating the test with the engine running resulted in the LED remaining OFF. Apparently there must be some sort of over-voltage protection in the Baofeng charger base that goes into effect between 13.2V and 13.8V.

After I packed everything up and went back in the house, I realized I should have tested my TYT BCG-F8 charger base. It is marked 13.8V on the bottom. So back out to the car. The works fine in the car with the engine running. So if it has over-voltage protection, it must be set to trip at a voltage higher than 14.1V.

If I remember correctly, there is a 0.6V drop across a rectifier diode. So you should be able to put one inline to drop the voltage from the power supply to the charger base to 13.2V. Two diodes in series should give you 12.8V. Or you can consider getting the TYT charger base (mine was $13.50 USD from 409shop). IMHO it is the charger base that should be included with the UV-5R.

Right. I downloaded the CHIRP software awhile ago. I was just asking whether there was a specific Yahoo CHIRP Group that a previous poster was referencing. There's always one good group (at least) and a bunch of so-so groups and rather than waste time finding and evaluating them having someone who knows just give out the URL allows us to go right there.

The version 0.2.2 does not specifically mention the UV5R but the latest daily build I downloaded today does. But the daily build does not invoke the Python top banner when it is loaded. This may be a missing SW hook somewhere or maybe the daily build does not work with the Mac.

> 1) Do "they" make a "AA" battery pack for this radio?

As the other gentleman answered, no Aa, but an extra battery can be bought for about $17.00 on ebay. For a few bucks more, $26.00, there is a double size battery available. I just got one of these and it charges from the same charger. The feel is quite solid, and the balance is good. The radio is actually easier to hold and operate with the larger battery, at least, for me.
>
> 2) I found one on Amazon.com where the radio & USB programming cable come as a package "deal" for $65.00 (Free S&H). This "sounds" like a good deal, but does the programming software come with it, or do you have to search the internet for it?

I have also just received a second UV-5R for a friend who doesn't do ebay. My UV-5R was $48.50 with free shipping. His was $53 and some odd cents, but came with a programming cable and the software on CD. The same software is found in the Files section of this group. I think that was an outstanding value.

> 4) Does it work well when connected to an external antenna? For backpacking purposes I'd use a roll-up Twin-Lead J-Pole.

While I have not operated the UV-5R from a roll up J-pole, we have rigged up a Yaesu HT with one of N9TAX's window line J-poles and it works just fine. I can't see why this would not work as well for the UV-5R. You can't make one as cheaply as you can buy one from N9TAX, and he gives you choice of connectors and 16' of coax all for a reasonable price, about $22. And for backpacking, a roll up J-pole is much easier to carry than a mag mount (and ground plane?). Look up N9TAX dot com.

> 5) How about audio quality? I see that it can receive the FM broadcast band as well. Would be nice to have decent audio quality.

Seems OK to me. It's not Onkyo (great FM tuners!) quality sound, but for what it is, OK.

> Convince me that THIS is the radio to buy!

You could do far worse for $48 - $53.

73,
Paul - AE5JU

Could you do some transmit audio level measurements? I have experienced weak transmit audio on my first uv5r and a replacement sent by the vendor. And yes, I purched an external speaker/mike, with the same poor results. Seems that the problem is a characteristic of this radio. You have to "eat the mic" to be heard.

Hi people,
 I finally got my HT last week, and up until now I learned how to fiddle with it and today I made some serious measurements that I want to share.

My LCR is Ver. BFB251 with 1203211 / Ver-05.

Battery fully charged.

VHF test frequency is 150MHz.
UHF test frequency is 450MHz.

Measured VHF LOW power is 1.56W
Measured VHF   HI   power is 4.2W
Measured UHF LOW power is 1.26W
Measured UHF   HI   power is 4.91W

Squelch measurements on same test frequencies
with a 5KHz bandwidth, 1Khz tone modulation.

Minimum sensing carrier was at -134.6dBm. (I could clearly distinguish the 1KHz tone when switching modulation on and! off on my generator)
Also noticed a 0.9dBm squelch hysteresis.

UHF:

Squelch level	signal level
0	opened all the time
1	-128.0 dBm
2	-126.7 dBm
3	-125.8 dBm
4	-124.9 dBm
5	-123.7 dBm
6	-122.8 dBm
7	-121.9 dBm
8	-120.9 dBm
9	-119.8 dBm

VHF:

Squelch level	signal level
0	opened all the time
1	-127.5 dBm
2	-127.2 dBm
3	-126.9 dBm
4	-127.0 dBm
5	-127.2 dBm
6	-127.1 dBm
7	-127.1 dBm
8	-127.0 dBm
9	-127.3 dBm

If I can find the time, tomorrow I will perform adjacent channel interference measurements.

So sorry I am not allowed to say anything about the equipment I used.

Cheers!

> Convince me that THIS is the radio to buy!

If you expect the UV-5R to be comparable to a Icom/Kenwood/Yaesu HT costing many time more $$... you will be disappointed.

If you expect the UV-5R to be without flaws... you will be disappointed.

If you expect the UV-5R to have a decent owners manual... you will be disappointed.

If you expect the UV-5R menus to be easy to understand and always make sense... you will be disappointed.

If you expect the UV-5R experience to be frustration free... you will be disappointed.

But if you can tailor your expectations to be compatible with that of a ~$50 LCR and be willing to accept the UV-5R's shortcomings (some listed above), and then add the bonus capabilities enabled by CHIRP and the suport from this group, you will find that "THIS is the radio to buy!"

The HT PTT is automatically disabled when you insert the spk-mic jacks.

Just a quick question.

There are two different models on the 409shop site:

http://www.409shop.com/409shop_product.php?id=106516
http://www.409shop.com/409shop_product.php?id=106518

One is 5cm the other 8cm. You are confirming it's the 5cm model that works well?

Tks

Speaker/ Mic or Internal...
Some have experienced audio issues with both, however,
I have had excellent audio reports from both.
I talk in a normal voice about an inch away from the mic.

5079. UV-5R power ON and monitoring while being charged

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-27 20:01:15 UTC
From: kd5pxh
Topic: 5079 Message: 5079

Greetings All,

Has anyone tried to leave UV-5R in charger, and while it is charging, have UV-5R with power ON, and monitoring?

73,

KD5PXH Mike

5080. Antenna For a 18' Fiberglass Boat

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-27 20:03:41 UTC
From: michael.mell@ymail.com
Topic: 5080 Message: 5080

I'd like to install an antenna on my 18' fiberglass boat to use with the UV5R. Whether I use a rail mount or drill a hole through the fiberglass is a secondary concern but I would like to take it down when docked overnight (so something that easily unscrews or detaches without breaking is important).

Anyone done this? Any antenna recommendations?

5081. Re: Mac OSX Snow Leopard CHIRP UV5R

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

From: Alek Kristola
Topic: 5080 Message: 5082

I use an NMO mount on my car. It unscrews quite easily. They make caps
to protect the threads when the antenna is removed.

Yup, no problem doing that that I have noticed, only takes longer to get charged back up.

For something like that I strongly recommend the Diamond X-50AN. It's more money of course. I have one and it rocks with the UV-5R. Although as others have noted, the receiver has a tough time with really strong signals. I live close enough to a local police repeater antenna that the radio occasionally has trouble with interference from the PD repeater when tuned to the ham band.

Testing my 5R showed better than 4.5 Khz dev. And if you were a loud talker it peaked at 5.2 Khz Dev.
Mic sensitivity was on the hot side.
Does anyone have a clean, readable PDF of the schematic?

Robert

There is a FAQ on the UV-3R Yahoo Group that is simply excellent. Of course, these are two different radios (-3R vs -5R), but the subjects covered and how it is written should be a good model for an FAQ here.

A similar FAQ was the first thing I looked for here when I bought my UV-5R and joined the Group.

This is a couple of bucks worth of 300 ohm stwin lead in a pvc pipe. I would be concerned about the velocity of the pipe and SWR. I don't think the bandwidth is going to be very wide at all. I would try the n9tax slim jim. $26.00 Dual band comes with 16' of quality coax and end connector of your choice. I ordered 2 along with a "HT saver" jumper with the sma connector on the end .response was great and the antenna works great and folds up into a small pouch.

The battery eliminator has been suggested by several people, but my question about the "AA" battery pack was so that I could operate on much larger capacity batteries, or alkaline batteries. Yes, the battery eliminator is a nice idea, in a mobile configuration, but I'm thinking more for emergency contingencies.

Rod,

I have the battery eliminator and it works well both in my motorhome as we stop and in the car. The standard battery lasts several days in rec. mode and not as much TX mode as one would assume. Extra battery size is avail (3600mah), probably better off with 2nd battery.

I use a flex J-pole also and it gets out TX 35-40 miles to repeaters and RX a little further. All makes for a neat QRP station.

I just ordered my 2nd (red this time) 5R, can't immagine life without one.

Subject: [baofeng_uv5r] Questions

Hey folks, I'm new to the group.

I've been looking for sometime for a small, cheap, 2m/440 handheld and ran across this particular radio.

I have some questions that I'm pretty sure that you all could answer.

1) Do "they" make a "AA" battery pack for this radio?

2) I found one on Amazon.com where the radio & USB programming cable come as a package "deal" for $65.00 (Free S&H). This "sounds" like a good deal, but does the programming

software come with it, or do you have to search the internet for it?

3) Can this radio plug directly into the Accessory port (cigarette lighter jack) of a 12-vdc vehicle? I have a couple of solar panels that produce approximately 13.8 Vdc and it would be nice to be able to charge it that way as well.

4) Does it work well when connected to an external antenna? For backpacking purposes I'd use a roll-up Twin-Lead J-Pole.

5)
How about audio quality? I see that it can receive the FM broadcast band as well. Would be nice to have decent audio quality.

Convince me that THIS is the radio to buy!

Thanks!

Rod

While Radioreference often has the frequencies needed, be aware that many trunked radio systems across the country are in the process of "re-banding". Since this process often requires frequency changes to the radio system, you might try some local resources to confirm that your frequency info is correct.

5099. Unable to Install Windows USB-to-Serial Drivers???

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-28 03:08:12 UTC
From: John Kintz
Topic: 4518 Message: 5099

If you're having difficulty installing your USB-to-Serial drivers into Windows 7 or Vista, read on....

For the last few days, I've been wrestling with Windows 7 trying to install the USB drivers for a Wouxon/Baofeng USB programming cable. No matter which Prolific driver version I tried, either it would not load at all or, more often, I would get the message "The name is already in use as either a service name or a service display name."

Try as I might, I was not able to locate and delete any previous USB Com Port drivers... that is until I happened across this site that had the step by step instructions to resolve just this issue:

http://southsko.wordpress.com/2009/03/16/fixing-the-name-is-already-in-use-as-either-a-service-name-or-a-service-display-name/

The solution on this site, in conjunction with the Wouxon USB drivers on Powerwerx.com (filename USB7VISTA.exe) finally allowed me to load the drivers that worked with the USB cable. Note that some adjustments to the Windows Registry are required, but it was pretty straightforward and not complicated at all. If you're having this particular driver issue, give it a try. It worked for me.

Good Luck,
John

Wait a minute...

I haven't heard "The name is already in use as either a service name or a service display name" as being a problem here. It's unrelated to the poisoned driver problem. That may have been part of YOUR problem, but it is not a problem in general.

Many people are confused enough as it is. Let's not complicate things.

This link is to a wholesaler but they have fold over marine mounts that you should be able to order from your normal marine parts retailer
With these you don't have to remove the antenna
You just need to figure out what antenna will work best for you since you don't have a ground plane and then get hardware to connect it to the mount
http://www.wholesalemarine.com/c/19000201/Antenna+Mounts.html?gclid=CLjlqeO7u7ECFQFx4AodvygAAQ
But if you do have a chunk of topside ferous metal somewhere why not go with a mag mount
Whichever way you go I would recommend getting a pigtail to connect the antenna coax to the radio rather than a screw on adapter, it will relieve stress on the SMA connector from the weight of the coax

And even more fun is that many are going P25 digital, so you'll need to buy a GRE or a PRO-106 or PRO-197. This radio is easier to program then the Bearcat. Of course, I use software to program my digital scanners.

the sheriff.

While Radioreference often has the frequencies needed, be aware that many trunked radio systems across the country are in the process of "re-banding". Since this process often requires frequency changes to the radio system, you might try some local resources to confirm that your frequency info is correct.

Testing my 5R showed better than 4.5 Khz dev. And if you were a loud talker it peaked at 5.2 Khz Dev.

Mic sensitivity was on the hot side.

Does anyone have a clean, readable PDF of the schematic?

Interesting results on the deviation, what band was this on, and what had you got the radio set to either narrow or wide, also, what equipment did you use?
I found my uv5r suits my voice better on narrow, and here in the UK some repeaters are narrow, I noticed this when using an alinco which has no option of narrow via menu, and so I swapped to the uv5r and my audio report was better.
I am intending to narrow the alinco via its hardware and hence my questions on tests.

5110. UV-5R - UHF CB- Duplex settings for repeater use.

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)

Hi all. Long time lurker but lurk all i like i cannot find an answer.

All i want to know is the settings in the duplex field for uhf repeaters? Using Chirp it shows an option of off, none, +, -, or split but nowhere on this planet is there anything that explains what they are used for.

I only want to know the settings in case i need to transmit on a UHF CB repeater.

I understand there is some link between a repeater channel and an input channel 30 more up the scale. As to which of the 1 to 8 or 31 to 38 should have what duplex setting i cannot figure.

BTW.. I have removed uhf ch 41 to 80 as they are of no use to me and also have no use for vhf or anything relating to that.
I am also aware that ch 5 and 35 uhf are emergency channels and that i am not to transmit on vhf channels. :-(

Simply... does anyone know the duplex settings for using uhf cb repeaters with a uv-5r & programming it with Chirp?

Thanks. :-)

I disagree, George. My problem WAS related to the poisoned driver problem... That's why the "hidden" driver wouldn't work with the Chinese USB cable. In my case, however, simply re-loading the correct driver wouldn't work.

I had to figure most of this out, on my own, by trial and error. I posted the information here - not to confuse everybody - but to help someone who might unknowingly have the same issue. If my post doesn't relate to YOUR situation, then I guess that's a good thing!

The information is there- you just have to dig. I am in the USA but think I see what the AU CB frequencies are about. Channels 1-8 are your Receive frequencies and Channels 31-38 are corresponding Transmit frequencies. They are all 0.75 Offset and the Tx is higher so Offset is +. Use the Channel 1 as your Rx and an Offset of .75 +

The offset for CB seems to be .75. Chirp +,-,none and off refer to this offset. You just insert the RX freq and the offset is set automatically for VHF & UHF. I don't see how Chirp will work for you yet as the offsets are pre-determined so you may have to use the Baofeng Software to accomplish this task?

Withe the factory software you enter the freqs seperatly somewhat of a pain but it works and what I use mostly.

Hope this helps,

John

Eh? Just set the Duplex to + and then set the Offset column to "0.75".
There's no need to go into the channel edit mode (although this will
work too).

Or, if you prefer to use the TX frequency, set the Duplex to "split" and
type in the corresponding transmit (repeater input) frequency into the
Offset column. Chirp will convert that to +0.75 when you save.

Thanks again John.

I may??? have answered my own question just after posting it.
On here in the files section there is a file for 80ch UHF CB
configured for Australia uploaded by some kind member.

When I opened that in Chirp I found what I may have been looking
for. For anyone else needing it in the future i will give the details here...

>> Duplex for 40ch... set all from ch1 freq 476.425000 to ch40 freq
477.400000 as "None" except for ch 31 to 38 which must be set as +.

With ch 31 to 38 change the offset column to 0.750000

Re load and all should be fine.

For those using the full 80 ch just repeat the above for channels 71 to 77.

Of course the easiest way would be just to install the aussie 80ch file from here
http://f1.grp.yahoofs.com/v1/UOITUK0gZdlWJZxfK3b3UmsO9TLqWw4d8juQTFHOMCQbeDKy9DiadAvg29KHN

I bought one of the 12v battery replacer doodads (slides in like a battery) and it runs fine from 12v socket. See below.

> I have a couple of solar panels that produce approximately 13.8 Vdc
> and it would be nice to be able to charge it that way as well.

My wallwart claims 8.4vdc output (and the voltmeter confirms it's very close to that), so maybe the tray is just a pass-through.

I think some have reported receiving charging trays that run on 12vdc.

My 2m mobile rig (mounted as a base) runs off 12v deep cycle fed by 45w of panel. Works fine. I also charge my phones and other widgets from the usb and 12v "lighter" socket in the charge controller. Could buy a power supply but I'd like comms in case of a power failure...

Mutley,

Referring to this web page, http://www.vkham.com/Repeater/uhfcb.html, here is how to set up the first repeater channel.

The Frequency column in CHIRP is always the frequency you will be receiveing. You will be listening to the repeater output which is 476.425MHz (channel 1). So enter 476.425 into the Frequency column.

So the receive part is done, now we move on to the transmit part.

I explained the meaning of the Offsets in message 4428. You can go back and read them if you wish. http://groups.yahoo.com/group/baofeng_uv5r/message/4428

The transmit frequency that we was is the frequency that the repeater listens to. In this case 477.175MHz. Since the transmit frequency needed is higher than the receive frequency, the + offset is selected.

So now all we have to do is tell CHIRP how much + the transmit frequency is from the receive frequency. The difference is .750MHz so 0.750000 would be entered into the Offset column.

The 1st repeater channel is done. So now upload this to your UV-5R and you will have the 1st repeater channel programmed. I programmed this channel and uploaded it to my HT and it worked fine.

Note: I tapped the SCN button to swap the RX and TX frequencies in the display to make sure that the TX frequency was correct. I didn't try to transmit on this frequency.

You should be able to figure out the other 7 repeater channels following the above example. And if the channel assignments shown in the example web page are no longer current, you should still be able to use the above example by substituting the correct frequencies.

Good luck,
Jim KC9HI

Thanks Dan. I almost suggested using split but I wasn't sure if it was specific to cross-band operation and didn't want to provide bad information. Using 'split' will be useful if you know the RX and TX frequency and don't want to do the math. HIHI

I have 3R, 5R, and UVD1P and all work quite well with the factory antenna. I do get slightly better performance with a long (18") antenna but not enough better to put up with the long antenna annoyance. For real performance improvement I use a mag mount on the car and a jpole on the house roof.

I just bought this:
http://www.ebay.com/itm/ws/eBayISAPI.dll?ViewItem&item=220965469286

It's a cheap chinese speaker mic but seems decently built and is supposedly rainproof (I need this for my application).

Sound quality reports are positive so far and I think it sounds fine. It also has a 3.5mm jack for an earpiece. It's a left ear mono as far as I can tell.

Would I recommend it? Well, I wouldn't recommend against it.

I'll be following this. I use the 12V battery eliminator and clip it to my dash cup holder in my Ford. Using the speaker mic pulls it off/out of the cup holder.

I'm interested in other people's ideas. Despite the objections I've received on this forum, I am considering another UV5R to use as a mobile rig.

My research on that antenna shows it to be a 900 MHZ antenna. I would not recommend that antenna. Using it would cause serious damage to the radio. I was looking to see if it had the correct connecction. The frequency range is not comaptible.

There other threads about different antenna's that are compatible with this rig. I had a whip that I liked, but it was prone to breakage if not handled properly. Google "N9TAX slimjim" if you would like a nice portable base station type antenna.

I tried to find a thread that contained some info "something abut antenna's and gain" there is also a nice review on antenna's for this rig. The threads are too numerus and I could not find it. Maybe someone else can recall the thread.

Then you don't understand the problem.

The error you got happens when two manufacturers happen to use the same service name. It happens with all kinds of drivers for diverse hardware.

It is not caused by the poisoning problem. That happens because Windows is going out to get the latest Prolific driver which is designed NOT to work with counterfeit Prolific chips.

2 Meter offset (in the USA):
below 147 is -.600 KHz
above 147 is +.600 Khz
147.000 can be either.

Don't forget to program a PL/DCS code for transmit.
A tone is not needed for receive unless you're in a
noisy environment and can't squelch the radio.

OK... my first suggestion is to avoid suggestions of any antenna that normally has a car or truck under it to use as a ground plane. Unless, of course, another owner of a fiberglass boat can vouch for a particular design.

I would go with a homebrew jpole made from twin lead, enclosed by a pvc or a plastic tube. It could be hoisted, strapped, or just plane hung on the mast at a height convenient for the distance you want in normal operations; of course, the higher the better.

You didn't mention either the band of operation or if the communications was meant for a bluewater or inland waters boat.

got mine yesterday.

hong litong hl-uv8r:
2 meter,220 and 440
just a little bit bigger than uv3r
easy to program
5 watts 440
6 watts 220
loud rec audio
keypad lights up
100 channels
only has hi and low power out

mine came with bad charger.
im going to exchange it for another.
$44 cant beat it, if i can get one that works right.

Check out Deal Extreme. Their site search engine isn't the greatest, so try your search terms in a couple of different ways. I like Deal Extreme because the users can actually post Amazon type reviews of the product.

The search of "Speaker mic" turns up pages of items, while "Kenwood Speaker mic", only a one page.

Prices can reach levels below the ebay sellers. Many of these same items can be found on ebay, but w/o the user reviews. To be informed is to be forearmed.

Date: 2012-07-28 16:35:20 UTC
From: Charles Scott
Topic: 5080 Message: 5141

Michael:

A simple dual-band mobile whip mounted to a rail somewhere will work just fine. The rail will make an adequate counterpoise. There's a variety of simple mounts that mount direct to a vertical or horizontal rail and either have NMO mounts and cables on them or have a hole for a mount. There's also some that come with radials if you have some place where you can clamp to a rail where the radials won't get in the way. Using an NMO type mount would mean the antenna could simply unscrew when you wanted to take it off.

If you're looking for something more substantial, I suggest the Diamond X50. It's a relatively short fiberglass covered dual-band base antenna with relatively short radials. It's not too hard to adapt one to a marine ratchet mount and other than the radials they mostly look like they belong on a boat. They also have a high wind survivability if you have twin gas turbines and surface drives in your yacht. I had one on my earlier 32' Carver (yuck!) and it worked fine. It would not be easily removable, but on a ratchet mount you could easily fold it down out of the way.

Another option is to mount some mobile antenna on a small stainless plate that's mounted high up through some fiberglass (which appropriate seal of course). Rather than having external radials or counterpoise, you can simply tie a pair of wires to the mount ground and toss them in opposite directions inside the fiberglass structure (radar arch or whatever). Again, being an NMO mount, the antenna would be easily removable.

I don't recommend a J-Pole for this application. The J-Pole is a compromise antenna that would require more vertical space than a standard 1/4 wave or many dual-band mobile antennas. Also, the antenna really needs to be fed at a right angle to the antenna, which gets awkward. Besides, the last thing I'd want on a nice boat is some klutzy makeshift antenna. I also didn't like the nice 3' long hole the 60' Tollycraft parked behind me put in my aft overhang a week ago, but at least*I* didn't do that intentionally.

I have praised my speaker-mic before for its sound quality and overall
"heavy duty" kind of feeling when you grab it.
Also the cord is very long, which is good when you want to use it in a
backpack or have it "laying around" in the car.

Here's the link to the shop I got it from -
http://www.409shop.com/409shop_product.php?id=103758

It has a yellow button that I still haven't discovered what it is supposed
to do?

My concern exactly. I'll throw my radio in the pack and use the speaker mic through a hydration bladder port. If the speaker mic craps out on me, so be it. Although, it's almost as much as the radio!

I mean, these radios are so cheap, I'm considering buying a second instead of replacing the charger I lost. I mean $15 for a replacement charger, $15 for the battery...the radio alone should only cost $15.

N,

Dan would probably add this feature to CHIRP. If you would find it useful, make a request via the Tracker system on the CHIRP website.

5150. eBay seller suggestions

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-28 19:44:58 UTC
From: bradahj
Topic: 5150 Message: 5150

Ok.....I'm now ready to buy, but was hoping to get some advice on which eBay seller to go with..... there are quite a few. I did find one called "Charger Angel" that ships out of California.... I'm trying to get info on "warranty."

I did think, too, that buying from Amazon (for a few dollars more) might be a way to go as Amazon is pretty good about making things right.

Thanks for any leads.

I forgot who I ordered my radio from off eBay, but it was shipped and came in an Amazon box from Sain Store. The eBay price from the seller was cheaper than their Amazon price, but I have no clue how I'd have dealt with a return.

Never had to deal with eBay on returns, but you are right about Amazon. They have great customer service.

Dave, Ron, Scott, and Frank, Thank you all. Every bit has helped. I have begun to make more sense of what I need and its lingo versus what the Baofeng has options for. At this point I have figured out how to set up several repeaters and have used this radio in simplex. I do like the fact I had to work so hard (call me crazy) to figure out this little radio. It has given me an insight into it and a little more understanding of what and how it works. It also freed me up to study for my license. So hopefully tomorrow I will make it to a test location. As far as the CB, I can't really knock it. I have been into Cb radios since I was 13. I am now 39. I have always had an interest in HAM. (not just Bacon) I also am a truck driver and it has been a very useful tool. That said, I have had enough of the childlike games that come along with it so I guess it is time to move on up. I will never get away from CB radio but figure I am expanding my horizons so to speak.Anyway thank you all and 73. Hope to talk to you all sometime on this little HT.
Art a.k.a. TruckCentral

I've had it three months or so. Audio reports good as long as I talk okay into the mic, but I don't talk any different in it than my Motorola Saber. Might just be that I'm naturally a quiet talker that it feels I'm raising my voice.

Hi,

My UV-5R (Firmware BFB251) maybe has a slight bug?

The transmit back LED in the display (orange) will only flash on for less than a second when I key up, IF there were no other coloured backlight leds on when I keyed up.

If, for example, the blue one was on, because there was an incoming signal, or the purple one because I had touched something, then when I keyed up, the orange one would stay on for the remainder of the duration set for the blue or purple light.

Odd, not a show stopper, and just another little "characteristic" that endears me to the radio :-)

Bernie,

I bought my UV-5R from Ed, Importcommunications, at Dayton this year. Paid a bit more than some of the guys but received a version BFB238 that has performed flawlessly. Downloaded the software from their website and had the radio up and running from my motel room before I headed home to Indiana. I also purchased an extra standard lithium ion battery and the programming cable.

Bernie,

I bought my UV-5R from Ed, Importcommunications, at Dayton this year. Paid a bit more than some of the guys but received a version BFB238 that has performed flawlessly. Downloaded the software from their website and had the radio up and running from my motel room before I headed home to Indiana. I also purchased an extra standard lithium ion battery and the programming cable.

5170. UV-5R with Bad display segments....but works great

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-29 14:42:40 UTC
From: kc2zki@gmail.com
Topic: 5170 Message: 5170

I purchased a UV-5R from Solid Radio out of Hong Kong for $53.50 including cable and software. The same guy has the UV-5R for $48.50 without the cable or software.

http://www.ebay.com/itm/170834219526?ssPageName=STRK:MEWNX:IT&_trksid=p3984.m1497.l2649#ht_5778wt_1037

This unit works great. I have one 2m repeater and one 70cm repeater that I am on most of the time. The 70cm repeater is about 10 blocks from my house and the 2m is about 6 miles. No trouble with long QSO's on either band.

My only gripe is that the LED segments to the left of the frequency display (including the last column of the frequency) is out. I emailed the company and they responded within 30 minutes offering a replacement. I don't know how much it would cost me to ship the body back to Hong Kong, so I think I'll just keep it the way it is. Hey, you get what you pay for!

Anyway, its a great little unit. I still use my ICOM 92AD for DSTAR fun, but this Baofang is a perfect disposable, knock around radio. You just can't beat these prices. I think I will order two more for my office and other car.

5171. Baofeng software crash - Run time error '8020'

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-29 16:04:16 UTC
From: dave.farrant
Topic: 5171 Message: 5171

Hi all

I've just got my new UV 5R and I'm trying to download the initial data state before tinkering around.

Using the latest Baofeng utility - shows V 12.03.05 in bottom of screen - I am getting reproducible software crashes with the error message - Run time error '8020' Error reading comm device.

Using Chirp I can read the device all the time, even after a Baofeng software crash. I'm obviously not trying to run both pieces of software at the same time.

Using a Megavolt USB to device cable which is not a true Prolific chip with an older driver which is working.

Using FindComPort to locate the active COM port and have used a number of different USB sockets (and hence COM port numbers). Anyway since Chirp is working this can't be the problem.

Running Windows 7 64 bit with 8 Gb memory.

Any ideas how to get the Baofeng utility working?

Dave (M6DFA)

Go back and read the archives. This is a driver problem. CHIRP and the
Baofeng software use different serial port "toolkits". The one CHIRP
uses is much more forgiving, being based on open source software,
the BAOFENG one uses a Microsoft toolkit and it is much stricter about
following specs.

Geoff.

Many thanks.

I had already hit the automatic Windows Update problem and reverted to an earlier driver (3.3) but it wasn't early enough!

Problem sorted now.

I bought through Amazon
I don't remember if it was shipped from Amazon or Sain Store but it arrived a couple of days after I ordered it, cable a few days later
I got an email a bit later from Sain Store asking that I rate my purchase experience
I replied saying that I may have a radio jssue and preferred to wait on rating until I was sure everything was working properly
They have been very proactive regarding my issues
I would definitely buy through them again and am hoping they add some of the accessories I have suggested (high capacity battery, acoustic tube earphone, ets) to their offerings

Dave,
v12.03.06 is the latest. It is in the files area as

"UV_5R_P 20120425.rar"

But before you install it, I would suggest that you download and install this file from the files area

"UV-5R_2 Setup_Files.zip"

It contains all of the setup files (one or more of yours may be missing, outdated or the wrong version). Hopefully this would fix it.

I am running Windows 7 64-bit here and have never had an issue running the Baofeng software. Probably because I started out with an older file that included a .cab file will all of the necessary files.

Also, I run the Baofeng software and the CHIRP software simultaneously all the time. I switch back and fourth downloading and uploading with both programs at will. I just never try to do a data transfer with both at the same time.

Hi...

Go to Deal Extreme web page, search for "speaker mic", read the reviews.
You'll see the same things on ebay, w/o any reviews. A good looking one is "kenwood speaker mic", with good reviews. I read about it there and ordered one with my uv5r.

Jim,

No. the charger base takes 10V-12V and regulates it to 8.4V to charge the battery. Read message 5062 for more details of what it can handle.

5180. Charger base a pass-thru

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-29 21:01:17 UTC
From: Jim
Topic: 5050 Message: 5180

(My apologies for the previous "empty message OOPs"!)

No, it's not, and don't treat it as such.

Recent messages by group members have provided the operating voltages of the wallwart and charging base.

Someplace below 8.5vdc and above 13vdc the charger base will shut down and there will be no charging taking place; the LED indicator will also not operate "normally".

I've not taken the wall wart apart, but have measured it's ac ripple at 0.008vac. Looks like a small switching power supply to me, and I would trust no older types of wallwart to be plugged into the charger base.

Normal wallwarts of the older type have standard transformers, bridge rectifiers, and filter capacitors. I would not use this type on the charger base because they have poor voltage regulation. If the wall wart is spec'd at 2amp at 12vdc, that is usually the loaded maximum condition. If you test it under no load, or a small load, the voltage will typically be much higher... like 15 or 16 volts. Not worth taking the chance with your charger base, unless you can measure the voltages and make a dropping circuit.

As mentioned in the group, it is an "easy fix" to put some diodes in series to drop the voltage of other sources to a comfortable level for the charger base.

Speaker mics are normally clipped to the collar of the user, while the radio is carried via holtster or belt clip. In inclement weather, the radio is under a jacket, coat, or weather gear.

That type arrangement is standard in any industry. It protects the radio from the weather, and more important, gets the antenna away from the user's eyes and head.... preventing a myriad of medical conditions.

Those arrangements were "standards" until cell phones came out. But I wouldn't worry about those... the cell companies say there is nothing to worry about....

Are you in frequency mode or channel mode?

Are you programming manually with the keypad or using a computer and software? Which software?

When you press the PTT, does the display change to the TX frequency? Does CT show up to the left of the upper display?

If you are new to Amateur Radio, we conclude you do not have your Amateur Radio License.

When you go to enter frequencies in your UV-5R for repeaters and such, without a license, you are in violation of FCC (or other governing authorities abroad) rules and laws, the very moment you transmit to kerchunk an Amateur Radio repeater.

Martyn is correct, find some hams and a club, someone should Elmer you and can use their license as they sit with you and explain these things.

We're here to help. Keep in touch and let us know how well you are doing.

Best regards,
Mike, KD5PXH

Subject: [baofeng_uv5r] Re: New to ham radio and need help!!

If you're new to Amateur radfio, then I would suggest you start by finding the details of your local Ham club/group/society, and find out about studying for your licence.

regards, Martyn M3MDY

It sounds like you could hear the repeater if you heard them discussing your weak signal so your receiver must be OK. Remember that repeaters can talk farther than they can hear- they transmit high power and try to listen to your very low power, so you can often hear a repeater that you can't talk to. If you were just barely hitting the repeater, they could hear you breaking the squelch and keying the repeater but your audio would be buried in the noise. Try driving closer to the repeater or get up on the roof- anything to get a better shot at the repeater. Is there a Ham club nearby? They will know what repeaters you should be able to hit with a HT. They could also talk direct to you to make sure your radio is working OK.

Somewhat similarly, mine came with 2 missing, adjacent, columns of LED segments in the display: The right-most column of the first character and left-most column of second character. Most of the time I can figure the text out. Purchased from 409shop. Came to a similar conclusion that it wasn't worth the hassle to replace -just get another in the future. The ease of warranty maybe a consideration in using a US vendor.

It's beyond me to spend $35 for a radio mount to hold a $47 radio.

It it just me??? :-)

I'd just Velcro the darn thing to the dash...

Not just you. I figure if someone knows it will work, I could use it for my GRE PSR-310 or UV-5R. That would make me feel better about the cost. Have to admit, I just saved it on my eBay check-later-list because I saw that it was RAM and the other (cheap) suction cups I've tried don't have enough suck to hold the relatively heavy PSR-310. For that matter, I haven't found a cheap window mount for my iPhone that works. My truck can be a bit of a bumpy ride.

I'm thinking the HT was programmed manually using the keypad and the step to program the TX frequency was left out. That way he would be operating simplex on the repeater output frequency. That would make the HT weak to all but those close to him.

Velcro doesn't stick to my vinyl dash. I've tried every type including the "industrial strength". The velcro holds fine but the gadget (whatever it may be) is always on the floor after a few hours in the sun.

I may just bolt it near the steering column using the machine screws for the belt clip. Then I can run some coax out the firewall to a dual band antenna. Just not sure how I want to do it yet...

There are windshield mounts avaiable for various applications and in my experience at least they do an admirable job.
So while $35 is a bit rich for me there are alternatives.

Try this one for about 5 bucks and a dollar to ship.
Im sure there are others but I grabbed this example because it was handy.

http://www.ebay.ca/itm/360-Car-Mount-Windshield-Cradle-Holder-Stand-Apple-Iphone-4S-4G-3G-3GS-/330725658894?pt=PDA_Accessories&hash=item4d00c9110e

Hi...

This is a statement of personal opinion.

The UV-3 and UV-5 are and very popular radios with new hams and their popularity will continue to grow. They fit the budget and allow new people to "get their feet wet" without a divorce or obtaining a second job. The questions that are generated by new hams, or those studying for the license, can be very basic... and sometimes tedious. We have all been in the same situation of not even knowing enough to ask a "decent question". People can be very vulnerable at times like these. Give them some courtesy, respect, and the benefit of the doubt. These radios do have uses other than ham radio.

So instead of asking to see a photo of their license, license application, study outline, or a note from their mother, lets try and be the most helpful group in the whole world.

Just think about this. If each of us were able to help two people get interested enough to buy the radio and get a license, the world wide ham population would triple in short order. That means there would be thousands and thousands of new people who have not heard our old jokes and stories.

Jimmie, K9JFK

The purpose of education isn't to teach us everything. Its purpose is to enable us to ask good questions.

IMHO the best answer for someone like that is to give them a firm, but
gentle nudge in the direction of an elmer.

While I understand that these radios can, and will be used for other
things, in other countries, if someone says they are a new ham, or an
old ham with no VHF experience, or someone who bought the radio and is
thinking of becoming a ham, I think we are not helping them by giving
them short, direct answers which get the problem solved, but give them
no long term help.

> So instead of asking to see a photo of their license, license

Hi !

I have two:

BFB231
1203211 VER05

and

BFB251
1203151 VER05

The second one has no sound at minimum volume level.

Subject: [baofeng_uv5r] Re: New to ham radio and need help!!

Hi...

This is a statement of personal opinion.

The UV-3 and UV-5 are and very popular radios with new hams and their popularity will continue to grow. They fit the budget and allow new people to "get their feet wet" without a divorce or obtaining a second job. The questions that are generated by new hams, or those studying for the license, can be very basic... and sometimes tedious. We have all been in the same situation of not even knowing enough to ask a "decent question". People can be very vulnerable at times like these. Give them some courtesy, respect, and the benefit of the doubt. These radios do have uses other than ham radio

So instead of asking to see a photo of their license, license application, study outline, or a note from their mother, lets try and be the most helpful group in the whole world.

Just think about this. If each of us were able to help two people get interested enough to buy the radio and get a license, the world wide ham population would triple in short order. That means there would be thousands and thousands of new people who have not heard our old jokes and stories.

Jimmie, K9JFK

The purpose of education isn't to teach us everything. Its purpose is to enable us to ask good questions.

Very weird!
My first radio arrived 4 weeks ago and is Version-05 1204171-BFB251 and no volume is heard

at it's lowest setting.

My second radio, just a few days old is Version-05 1204171 BFB231and you DO hear audio even at the lowest setting of the volume pot.

Just a caution on the use of cell phone mounts. They often require enough pressure on the side of the radio to energize the PTT. Look for something with a mic holder or belt clip attachment.

I have two, purchased from Sinotel in the UK on 10/07 and 25/07:-

S/N: 201204R32664 +3: VER BFB251 +6: 1203151 VER-05
S/N: 201206R09873 +3: VER BFB251 +6: 120702 VER-05

So far, I haven't found any difference in the way they operate.

regards,
Martyn

You also might want to look at the Panavise 777 Clip Caddy. It attaches anywhere there is a space for it; and it will hold almost any radio that has a belt clip.

Date: 2012-07-30 17:02:44 UTC
From: lajes67
Topic: 5225 Message: 5225

Very good posts, as it has been mentioned, this is my opinion, I have a UV5-R, I also have 2 Yaesu hand helds, I have purchased the 701 antenna and have very good results.
We that said, I recently participated in a charity event, it was a swim across the Great South Bay, in the past I have used the Yaesu VX6, great radio but, always had a "death grip" on it, I loose it over the side and that's over $300 of radio that I just lost! The UV5-R worked fine and, if I lose it yes I'm out some money but, there is a big difference between $50 and $300 plus.
Same would seem to go for people just starting out in amateur radio, if they have little or no experience in electronics or radio they have had to spend money on the study guide, $30, exam, $15, to some that might not seem like a lot but for others it is.
OK, "congratulations, you passed, here's your license", now what do they do? Elmer, right, great start, active local club, all great places to start off with and, here is a radio that you don't have to spend a lot of money on, perhaps the Elmer or local club can program the radio for the newcomer with all the local repeaters but, among other things they have to show the newcomer that there is more to Amateur Radio than just UHF/VHF on a hand held, HF, CW, SSB, RTTY, PSK, satellite, contesting, chasing DX and of course the most important: Years ago, when Harry Dannals, W2HD, was a Director and then President of the ARRL, he would hold his fingers about an inch apart and ask "why do this many people have access to, at this point he would stretch his arms wide apart,this many frequencies?...because they perform a service to the public, for no charge!"...hey, we might get a tee shirt from the event organizers or a free cup of coffee but that's it, ARES/RACES/Skywarn, that information should be provided to the newcomers but, that's my opinion.
Whoever it was that passed along the information about buying a #83 O washer for the Nagoya 701 antenna, thanks, fits just fine and covers up all the exposed parts.

Hi
We currantly have a few sets of mitex radio's uhf and vhf at work.
I have bought a UV-5R to save using two radios depending on the job in hand.
The first set of frequency's I tried to program are for the Mitex sport (VHF) using Chirp software
I got a list of frequencies off Mitex as below

CHANNEL Rx Frequency Tx Frequency QT/DQT dec
1 164.0500 164.0500 D627N
2 164.0625 164.0625 D627N
3 169.0875 169.0875 D627N
4 169.3125 169.3125 D627N
5 173.0500 173.0500 D627N
6 173.0625 173.0625 D627N
7 173.0875 173.0875 D627N
8 164.0500 164.0500 D734N
9 164.0625 164.0625 D734N
10 169.0875 169.0875 D734N
11 169.3125 169.3125 D734N
12 173.0500 173.0500 D734N
13 173.0500 173.0500 118.8
14 173.0625 173.0625 118.8
15 173.0875 173.0875 118.8
16 SCAN

The problem is they don't seem to work.
I think it is just me but there are a lot of columns, some of the channel's I can hear the Mitex but can't transmit to it.
If someone could give me some pointers as to what I should be selecting in the columns it would be much appreciated.

Those are all simplex so make sure your UV-5R is Tx and Rx on the same frequency-ie No Offset. Also, the Mitecs may have Tone enabled on Rx, so program the UV-5R with the correct Tone on Tx but NOT on Rx.

> in the columns it would be much appreciated.

The columns are RECEIVE frequency (the channel the MITEX radios listen on), TRANSMIT frequency (the channel they "talk" on) and the PL codes.

PL (aka Private Line, CTCSS, QT, and other names) are subaudiable (to low to hear) tones that the radio sends when you transmit.

The radios are set to use the tones as a "filter" when they receive, so that you only hear people whose radios transmit them. This DOES NOT mean that no one else can hear you, it just means that you can share the frequency with someone else and if you are careful, you won't interfere with each other. If you don't notice there is a signal but you can't hear anything, you can interfere with other users, so be careful.

Since the transmit and receive frequencies are the same it should be easy to set them up with CHIRP or the Baofeng software.

There are two types of PL tones, analog tones, which are a number from 60 to just over 200, and digital ones begin with a D and are either normal or inverted as in D123N or D123I. If you look at your list, most of the frequencies use DPL tones, and a few of them use analog ones.

Note that only some of the DPL numbers actually exist, so combinations don't work and are not valid. Some of the older Motorola radios have this restriction, but you should be OK with the UV-5R.

I suggest that you set the PL option to transmit only. That will allow you to hear all the signals on that frequency and if it works properly add the receive PL later.

Geoff.

I un-snapped as many of the adapter parts as I could from an old GPS suction-cup mounting setup and added a 3" strip of self-adhesive Velcro tape to it. I put another strip on the back of my UV5R and...

VOILA! It looks factory, it's strong as @#!!, and it works great.

73's y'all.

Hi
Thanks for all your help I can hear the Mitex on the UV-5R but not the other way around so I think it's these codes but not sure which i should change I.E
tone-tone mode-tone sql-dtcs code-DTCS poll-cross mode-duplex

I have tried a load of variable but no luck guess there is no room for error.
Thanks for the help

OK, griff279 - I'll give this a shot...

The columns in CHIRP are as follows:

Frequency - this is the RX frequency (or, if simplex, both the RX and TX frequency)
Name - as it says, up to 7 characters max
Tone Mode - for channels with a QT/DQT like 118.8, select "tone" from the drop-down
for channels with a QT/QDT like DxxxN, select DTCS from the drop-down
Tone - if used, select the correct tone from the drop-down
Tone Sql - disregard for now
DTCS Code - if used, select the correct DTCS code from the drop-down
DTCS Pol - leave at NN
Cross-Mode - disregard
Duplex - leave at none (for simplex channels)
Offset - leave at 0.000000 (for simplex channels)
Mode - select correct choice from drop-down (whichever mode the other radios use)
Power - select correct power level
Skip - If blank, channel will be scanned; if "S" channel will be skipped during scan

Hope this helps.

John

When programming freg, off set, tone, etc as transmitting and receiving frequencies into a channel everything goes fine until I switch to Channel Mode. As soon as I switch to Channel Mode the radio forgets either freq, off set or tone because it no longer gets into the repeater. Of course it is impossible to know which of the 3(or all of them) that is being lost as all you can see is Channel and it's number. Anyone know what gives? My Yaesu VX-6 looking better by the minute. Thanks.

Here is what should be in each column left to right:
164.050
DTCS
NA
NA
627
NN
->DTCS
none
0.0000
FM
High

You must Delete a Channel number before any changes will take. Del the desired channel, plug in the frequency,etc per instructions in Files section, and then Save the channel number.

UV-5R - programming a few frequencies easy, the Scan works great.

Q.) Is it possible to exclude a programmed frequency from the scan?

Example: I listen to the National Weather Service in my area (162.450Mhz)is programmed into the UV-5R.

I would like to exclude this frequency from the Scan...since obviously the radio always stops on this frequency since NWS "never stops talking".

Anybody know a trick? I'd like to keep this frequency programmed in..I just don't want the Scan to stop and hang on this frequency.

Thanks!

In the programming software set Scan Add to OFF and that channel will not be scanned.

Yes I did delete channel b4 hand. Also programming in A.

Found a work around by using instructions by B Brannan for repeaters with odd splits. No info is entered for +/- or off set. Just remember to set tone for ctss transmit and all is well. When I go to channel mode it looks like I am getting repeater confirmation. What a trial though.

If using Chirp software add "S" in the Skip Column, Using BaoFeng Software Scan column needs to be off. If you are not programming using software there is no option for this feature that I know of.

Besides the answers that have been posted, you might consider putting the
WX channel in the VFO and leaving it there.

When you're in memory mode, you can scan as much as you want, but when you
want the weather, you can stop the scan, hit the orange button and listen
to the WX.

If you are going to scan or otherwise monitor a frequency like the NOAA Hazards Radio in Frequency Mode, it would also be a good idea to set SFT-D (menu 25) to + or - and set OFFSET (menu 26) to 69.950 to prevent accidentally transmitting on an unauthorized frequency.

I counted 42 different radios. 8 resemble the UV-5R for functions and the other 34 seem to be "professionals". I think that they are producing more models than they can handle correctly.

I have visited their website before. It's like their User Manual, hard to follow and incomplete.

Anthony,
If you are setting up a simplex channel then make sure Duplex is set to '(None)' instead of 'off'. '(None)' is simplex and 'off' is TX inhibit.

Can I use my own regular 1/8" plug earphones? and still transmit with the onboard mic? I'm seeing some package deals and am trying to figure the best way to go.

Also, I have a Mac and am a little nervous about using Chirp....so am debating whether to get the cable.

Hi,

No. Well, not exactly. You'll need a 1/8 to 3/32 inch plug adapter, also stereo to mono. The speaker jack is the smaller of the two, the 1/8" jack is for the microphone.

The earphone socket is 2.5mm (3/32") so you will need an adapter. The PTT will still work with the adapter plugged in. I would spring for the cable if you are going to program more than a few freqs., also some "features" only can be programmed through software. Macs do have a work around I believe if not lower your pride and pick up an old MSDOS laptop for this use.

This is a great radio, be sure to read the many posts and your life will be almost stress free.

Assuming that the higher the BFBnnn number the newer the firmware, I did a search of the group using 'BFB2' as the search term and BFB251 is currently the highest number floating around in the group right now.

I think that you can look at the specs.... if they state 25 channel FM radio storage that it is the latest.

5260. Selecting uv-5r for radio

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-31 14:55:37 UTC
From: gehumes
Topic: 5260 Message: 5260

I downloaded CHIRP and when I try and select the radio to download from my only option is the uv-3r model. As a result, I cannot download from the uv-5r model that I have. What am I missing? The error message says "radio did not ACK first command."

I have this program setup on a WinXP OS if that's any help.

The UV-5R is not supported in the stable release. You need to use a CHIRP daily for UV-5R support. Check the group 'Home' page for the link to a web site that will give you links to the correct CHIRP software.

I have bought from a few places that I would consider reputable. 409shop.com, not an ebay seller but they take PayPal if that is important to you. Ebay user radio888, his ebay store name is RadioAccessoryShop. And what is now called importcommunications.com (formerly wouxon.us) also not an ebay seller. My experience with these places has been very good and I will buy from each of them again in the future but that doesn't guarantee anything. Have fun with your purchase.

I have never used CHIRP on a Mac but if it is as good as the Windows and Linux builds then it should be no problem. Just don't buy one of the cheap cables that will give you driver problems.

Hi to everybody !

I bought UV-5R (10 pcs.) from

http://stores.ebay.it/hk360radio?_trksid=p4340.l2563

Good price.

10 x UV-5R +
4 x leather soft case +
6 x USB cable

Only 350 GBP ($ 550)

Shipping cost included with DHL! (Italy)

HK360RADIO is eBay store's 409shop.....

Sorry for my bad English....

I purchased 2 uv-5r units and out of the box I tried them radio to radio and everything worked. I used Chirp to program them and I couldn't transmit audio on one of the radio. (it transmits but no audio). So I did a reset on both radios. After the reset I tried them radio to radio and still no audio transmit on one radio. I reprogrammed this time using the factory software and still no audio transmitting. Does any have any suggestions? I was going to send it back but the shipping is more then the radio cost. Is there anyone in the USA that can look at it?

Thanks
Anthony

5276. Re: Antenna For a 18' Fiberglass Boat

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-07-31 16:55:03 UTC
From: michael.mell@ymail.com
Topic: 5080 Message: 5276

Hi,

First, for references, I uploaded some shots of the boat so people can understand what real-estate I'm working with. This boat was bought to tool around within a large number of chained lakes we have here in Michigan. I wanted something the teenagers could take out for watersports and, at the same time, would fit under the various very low bridges and very shallow inter-lake access points. So it was a compromise from the start (not to mention had to be used and cheap so I wouldn't worry too much about the inevitable scratches and gouges I was going to have to fix).

http://groups.yahoo.com/group/baofeng_uv5r/photos/album/822437936/pic/list

My objective is to reach the teenagers when they are on the boat. There is no cell phone coverage. I'd be considering mounting the uv5r with a handset mic and extending its range with an antenna.

Installation of an antenna on a railing may be the best options as I have two in the front and two in the rear.

As another option I may be able to use one of the two compartments at the rear of the boat (you can see one clearly in the picture of the rear of the boat). There isn't any ferrous metal but I can always install some on the inside and mount an antenna on the outside. It's lockable and also has a passthrough for a rope or co-ax.

Michael

Well I was considering a mag mount only to 'try out' a unit I could buy for the car and then see if my idea of working it on the boat would fly. Then, after that, go with a boat-only solution.

However, there is no ferrous material that I know of on anything resembling a flat service so I would need to install a plate for this to work. At that point I may was well just buy one of the rail mounts. I do like the rachet ones as it'll allow me to adjust the antenna.

Good suggestions,

I'd start with a simple solution first. Part of the fun of this is begin able to keep it on the cheap. While I agree the X50A is a great antenna it's about the cost of two of the uv5r's.

I'll invest in a decent rail mount though... don't want a cheap one coming off at speed and dumping everything into the lake.

I posted some pictures in the Photos section. There's no mast here, just a speedboat for water sports. There will be a height issue as well as there are low bridges that need to be navigated. And when I say low I mean ducking youre head while you're sitting down low.

Give us some more information:

1. Do you have transmit audio on simplex?

2. Do you have receive audio on simplex?

3. Can you hear the repeater? Which one?

4. Can you "kerchunk" the repeater?

5. If you press a key, can a tone be heard on the repeater?

73,

Geoff.

If I interpret that correctly, you have no transmit audio, but since the tones can be heard on the repeater, the transmitter is set to the correct frequency and PL tone, and actually is putting out a signal.

Try holding the radio up to your mouth and shouting banging on the mic port etc. If anything can be heard, then you probably have a blocked microphone port. There are several postings on how to fix that either by taking the radio apart or not.

If you don't have any audio then the switch in the speaker mic jack may be stuck. I would take a pair of stereo headphones (with the radio powered off) and move it in and out of the jack (the larger one) a few times and rotate it.

If you have a Kenwood or Wuxoun speaker mic, you could also try that.

Michael:

Good pictures of the boat, and yes, the X50 is going to be a bit much for that boat.

I think your best location is to place the antenna at the stern end of the forward rail on the Starboard side. That will place the antenna close to the helm so you can bat the kids away when they start messing with it. That also keeps the antenna from being in close proximity to the engine (noise).

If you put it on one of the aft hatches or rails it may get in the way of people climbing back up on the boat and of course would be close to the engine.

There's a number of dual-band mobile antennas that would work well. Some of them are fold-over themselves, so you wouldn't need a ratchet mount. See the following URL. It's a great reference for these antennas. Shop around for price when you want to buy one though.

http://www.universal-radio.com/catalog/hamantm.html

The Commet SBB-5 and SBB-7 NMO antennas are fold-over. You could then use a Velcro strap to tie it to the rail for trailering. These will stand up to the weather and and wind on the boat. I run two SBB-7's on the back of my Durango and they're just fine at 70+ Mph.

You can also find antennas that are shorter with a spring like the Diamond AX504SP (PL259 mount) or Larson NMO 2/70SH. The shorter ones you wouldn't have to fold down for anything.

You didn't say what frequencies you're going to be using. If it's the Ham bands, then these antennas will all work for you. If it's something else (i.e. GMRS), then you'll need to pick antennas made for that frequency or ones that can be tuned that far off. Some of these antennas won't work real well 20-30 MHz off their design frequency.

Since that was so long ago, I'll ask:

1. Did you do a full reset via the keyboard at startup?

2. Did you reprogram the radio with the Baofeng software with an
original data file? (or as they say in the Motorola groups, did you put
back the codeplug you saved before you changed anything)?

N:

How did you configure the test environment? Can you post pictures of the test setup?

The problem with testing antennas for hand-held radios is that their behavior swings wildly between being connected direct to test gear, being on the radio sitting on a table, with the radio in your hand, and the radio on your belt. The best way to test is to attach the antenna to something that simulates the radio and put chokes on the cable where it leaves that assembly then test the antenna with it sitting on the bench, in your hand, and on your belt.

I've done this testing with some antennas and have seen 10 to 30 MHz swings in frequency and even minimal return loss (pretty much useless) when simulating a radio on a person's belt for some of them. (Which is why using a radio on your belt with a hand-mic can be very frustrating.)

Another poster explained that you may be desensing the radio that you are listening to, so you cannot hear that the repeater is transmitting.

If that receive radio is portable, you could move it farther way, or have someone else carry the radio into another room or outside and see if they can hear you.

I have a feeling that you have a setting wrong, possibly through no fault of your own, or possibly through a minor error than can be fixed.

I understand that if you set both of your radios to (for example, 146.520 MHz), then those two radios can talk to each other. This is good.

What if you set one radio to the repeater that you want to work, and set the OTHER RADIO to receive on the INPUT FREQUENCY of that repeater.

For example: if you have the "suspect radio" set to operate on the 146.94 repeater, the INPUT frequency would (probably) be 146.340 MHz because the OFFSET is (usually) minus 600.

Set the RECEIVE for the OTHER RADIO to 146.340, then transmit on the "suspect radio" and see if you come through.

If you can hear the signal on 146.340, then the radio is working. This means that there is something else preventing the repeater from hearing you. It may be that you have T-CTCS set wrong.

I agree with Dave and the others.

If you have audio on simplex, you Will have audio on a repeater.
If you are listening on the repeater's output, you are simply overpowering your receiver.

Even in the low power possition, you are just too close.

They offer window roll up mounts that use your HT antenna just to get it outside a vehicle. I think that if you purchased one of those $3.79 units it should work just fine. I get out over 20 miles with mine in the mountains.

Well I was considering a mag mount only to 'try out' a unit I could buy for the car and then see if my idea of working it on the boat would fly. Then, after that, go with a boat-only solution.

However, there is no ferrous material that I know of on anything resembling a flat service so I would need to install a plate for this to work. At that point I may was well just buy one of the rail mounts. I do like the rachet ones as it'll allow me to adjust the antenna.

I have bought from a few places that I would consider reputable. 409shop.com, not an ebay seller but they take PayPal if that is important to you. Ebay user radio888, his ebay store name is RadioAccessoryShop. And what is now called importcommunications.com (formerly wouxon.us) also not an ebay seller. My experience with these places has been very good and I will buy from each of them again in the future but that doesn't guarantee anything. Have fun with your purchase.

Ok.....I'm now ready to buy, but was hoping to get some advice on which eBay seller to go with..... there are quite a few. I did find one called "Charger Angel" that ships out of California.... I'm trying to get info on "warranty."

I did think, too, that buying from Amazon (for a few dollars more) might be a way to go as Amazon is pretty good about making things right.

Thanks for any leads.

Thank all for the suggestions.....

Ended up getting the unit with the earpiece for $49.99..... stock is in US so I should get it in about 3-5 days.

Next up..... the cable..... I'm finding some for about $8.50 on ebay..... Is it true that some cables are better than others? I understand that sometimes the computer doesn't recognize the UV-5R after it is connected.

Going for my Tech License on Monday..... should be fun!!

Yes, now I remember. Nicheone off eBay is where I got my UV-5R from.
Came in an Amazon box from Sain Store. I've had mine about three months I
think. Version bfb231.

I've had zero complaints. Next radio I would like quieter on no volume,
but it's not a huge issue for me. Delivery time was good.

Anthony,
We've had more than a couple UV-5R users lose TX audio after plugging in an external microphone or the programming cable. It appears that debris or something gets between the contacts while the external device is plugged in and keeps the contacts from closing after the plug is removed. I'm pretty sure that if you search the group you will find at least two were able to restore the TX audio by repeatedly inserting and removing a plug and/or using compressed air from a can normally sold to clean keyboards and such.

>
> I purchased 2 uv-5r units and out of the box I tried them radio to radio and everything worked. I used Chirp to program them and I couldn't transmit audio on one of the radio. (it transmits but no audio). So I did a reset on both radios. After the reset I tried them radio to radio and still no audio transmit on one radio. I reprogrammed this time using the factory software and still no audio transmitting. Does any have any suggestions? I was going to send it back but the shipping is more then the radio cost. Is there anyone in the USA that can look at it?

Of course, it just plugs into the usual charging base. Probably need some rubber bands to keep the radio from bouncing out.

When programming manually using the keypad, the channel has to deleted and completely reprogrammed it to make changes.

When programming with software, the channel is edited as needed and then the new 128-channel configuration is uploaded to the UV-5R

Have been reading posts about whether an FCC number is necessary in place of a SS# when taking these HAM tests.

Is there a privacy issue here? Why would one go through the trouble of getting this FCC # ??

"An FRN is a 10-digit number that is assigned to a business or individual registering with the FCC. This unique FRN is used to identify the registrant’s business dealings with the FCC. The FCC will use the FRN to determine if all of a registrant's fees have been paid. You are encouraged to register with the Commission as soon as you expect to do business with the FCC. This way, you will be ready to access any of the electronic licensing systems without having to go through the registration process at the time you submit an application. "

You don't have a choice of getting an FRN or just using your SSAN
If you don't have an FRN the FCC will assign you one when they process your license request
Using an FRN means that three VEs and who knows how many people between them and the FCC don't see your SSAN
As a VE I would rather you put an FRN down on the forms so I haven't seen your SSAN and would not be an identity theft suspect if you were that unfortunate

Caution... (Maybe.)

I got one that LOOKS the same; eBay item 300726502706

Mine has NO voltage regulation. (!!) -Straight-through delivery of the DC voltage from the auto's DC power port to the plug that couples to the UV-5R charger base.

What this means is that it will NOT charge the UV-5R, if the car is RUNNING! It is OK, if the car is turned off.

The max voltage I can apply to my DC charger is 13.3 volts; Above this, the charger base is OFF.

The two units LOOK the same; See the eBay listings.

The sellers are different, but this proves nothing.

Because the information is public. That is why the FCC uses your SSN to
give you an FRN which becomes your FCC ID and public to all who want to see
what license class you have etc.

My measurements were made with adequate equipment and show that the stock antenna performs better on 70cm band and my puxing SRH519 on 2m band. I'm sorry I can't give you more details about my environment, it's not because I don't want to, rather I'm not allowed to. Also from the pictures one can easily read the bandwidth were the antenna has a vswr value under 2, witch, from my experience is acceptable. Also one should take note
that these measurements are reflecting the two antennas I have, and from what I know, every antenna is a bit different... I know that measuring vswr should be done in the same conditions as normal use, and I tried to respect that as much as I could. Bottom line is, don't expect much from short antennas.
cheers, nick

From Sain via Amazon - paid for overnight shipping...can't wait. This will be my first brand new radio in over 20 years...

Trip to Boston on Saturday to test it out. I'll see what it can do in an RF rich environment!

My battery eliminator shows 7.6 volts when plugged in to 12v vehicle battery. Although you can't charge a battery with this arrangement it sure does make it easy to use.

If one really wants to use vehicle power for this purpose I gues that I would use a Tripplite or some such as they do regulate the 12-14 volt quite well and then to 120vac. Yup, 2 pcs of stuff but much safeer.

Subject: [baofeng_uv5r] Re: Car charger, there is one

Caution... (Maybe.)

I got one that LOOKS the same; eBay item 300726502706

Mine has NO voltage regulation. (!!) -Straight-through delivery of the DC voltage from the auto's DC power port to the plug that couples to the UV-5R charger base.

What this means is that it will NOT charge the UV-5R, if the car is RUNNING! It is OK, if the car is turned off.

The max voltage I can apply to my DC charger is 13.3 volts; Above this, the charger base is OFF.

The two units LOOK the same; See the eBay listings.

The sellers are different, but this proves nothing.

Yes, this is an outstanding bug that I've been ignoring. Set the ANI
code in the baofeng software to something like 88888, program the radio,
and then CHIRP will read it properly.

I need to fix it...

This information on charging cycles appears to contradict the instructions in the manual. The manual instructs you to fully charge and fully discharge the new battery 3 times in order to achieve "maximum battery capacity and performance." After (ugh) following these instructions I searched for tips on properly conditioning lithium batteries and the results confirm what Geoff has suggested. Hate to be cynical but perhaps Baofeng ultimately wants to profit from the sales of replacement batteries. Otherwise, why such contradictory instructions?

As my son says it's "copypasta". That is exactly what you should do with
a NiCAD or Nimh battery and NOT what to do with a Lithium.

Obviously the tech writing department did not get the right specs from
the engineering department. Or maybe they don't know any better, and
just added it because they always do.

Geoff.

Well, I find it virtually impossible to believe that NOBODY in the engineering/manufacturing/technical writing/printing/marketing/customer service/shipping departments knew that these instructions were completely opposite of proper charging techniques. But, then again, raising red flags, so to speak, over there may result in punishment beyond comprehension.

You are assuming that anyone who read the document reads English.

Very likely the only people that do at all, are the techwriters and a
few of the engineers.

Bear in mind too, that the radio is manufactured by TYT but the book,
charger, etc come different subcontractors.

The person who wrote the book may have never seen the radio, the
printers don't care what it says, and the person who puts it in the box
probably can't read English and does not use the radios.

It's also very likely that everyone in the chain of manufacturing to
boxing has an elementary school education at best, and the specs come
from people they will never meet.

Geoff.

You'll love it - in spite of a few quirks.

I must admit that I like this radio more and more and grab it often when I'm off to the park with my dogs. It's not the best radio I ever tested, true, but price/quality is off the scale.

For now it ranks #3 on my list, but the new Puxing PX-888K I received for review might claim that place soon.

This link is from Battery University and has been brought up before
http://batteryuniversity.com/learn/article/charging_lithium_ion_batteries

After reading it I think that the Baofeng manual is more correct than we give credit for although it does get confusing. Since the circuitry should shut the radio off BEFORE the battery is flat I do not believe that they planned for you to wreck your battery by following their instructions.

Also they point out that you SHOULD NOT leave your radio on while it is on charge, a fact that I have ignored in the past. Reading through this article it seems to me that they (BF or whomever) have covered the production of the charger quite well (soldering aside) and it does seem to explain some of the "quirks" that folks have noticed.

What a ride !

JL

I'm glad that I purchased a 2nd battery and a 12v battery eliminator that enables me to charge properly.

The $3.79 antenna is a nice looking flexible duck, surprisingly good, and you will notice a distinct difference vs the stock finger. In my case that means full quieting to a local repeater from my basement (silly of me I know), and reception of signals that were only scratches before. Honestly, it rivals antennas that cost 4 times as much. Spring for one no matter what else you do.
If you're determined to go more mainstream, I recommend the 21.1cm Nagoya NA-775. I say the 21.1cm version because there are multiple "775"s about. Some of the longer ones may be counterfeit. I have the little one in SMA-M for a UV-3R and quite like it. Big performance increase of the 3R's stock.
And just for the record, I agree with John and Andrew below, and many others--J-Poles and Slim Jims rock! They cost pennies, are portable, and perform like a house on fire.

I wanted to chime in and support the N9TAX Slim Jim Antenna. He makes a fine antenna and supports it with great before, during and after support. I have bought two from him and may be getting a 3rd. There is a review done by a guy called GUERRILLAGEEK on YouTube http://www.youtube.com/user/GUERRILLAGEEK that shows the fine points of this antenna.He is a tech that actually puts his antenna on a high end antenna tester and shows the results on video. This video is what sold me on his antennas. As this video states, you probably could not start from scratch and build this antenna (unless you had every particular required component already in your work shop)

I highly recommend this antenna.
Ron P
KB3VEW

NOTE:: I have no affiliation with this seller in any way. I just liked the product and how he conducts his business.

Subject: Re: [baofeng_uv5r] Re: What Antenna Would You Recommend - mobile/base

The $3.79 antenna is a nice looking flexible duck, surprisingly good, and you will notice a distinct difference vs the stock finger. In my case that means full quieting to a local repeater from my basement (silly of me I know), and reception of signals that were only scratches before. Honestly, it rivals antennas that cost 4 times as much. Spring for one no matter what else you do.

If you're determined to go more mainstream, I recommend the 21.1cm Nagoya NA-775. I say the 21.1cm version because there are multiple "775"s about. Some of the longer ones may be counterfeit. I have the little one in SMA-M for a UV-3R and quite like it. Big performance increase of the 3R's stock.

And just for the record, I agree with John and Andrew below, and many others--J-Poles and Slim Jims rock! They cost pennies, are portable, and perform like a house on fire.

I got mine off eBay. Got it in 1 week from China. Odd time auction end and I picked it up for $20.50. radioshop888 was the seller. I've bought several things from them with no problem.

They, and several other eBay sellers have websites outside of eBay. And it looks like no one in the US has them (on eBay at least). Someone's bound to start selling them eventually in the states.

Alex,

Usually you can go here http://www.uv-5r.com/ (Import Communications) he is in North Carolina. His site is reporting "out of stock", you might shoot him an e-mail and see what he says. I get good service from his company. I am not affiliated with his firm

John

It's very easy to get an FRN on the FCC's web site, and it means you don't have to provide your SSN. You should go ahead and get your FRN before taking the test. The URL for doing this is:

https://fjallfoss.fcc.gov/coresWeb/publicHome.do

You know the first one, but if someone does not, it is the Federal Communications Commission. They regulate most non-military radio services in the United States.

SS# or SSA number or SS number is Social Security Number. The Social Security Administration sees to it that money is withheld from (most of) our paychecks to take care of us in our old age. A Social Security Number is not to be used for identification, but in many cases it is. Stealing Social Security Numbers leads to identity theft, so more and more people are being very careful about who gets their number.

FRN is an FCC Registration Number used to identify those who conduct business with the Federal Communications Commission.

It is necessary to use the Commission Registration System (CORES) to get an FRN.

By the way, an FRN is not an "FRN number." The "N" stands for "number." This is just like the fact that a GPS is not a "GPS system." The "S" stands for "system."

U.S. amateur radio licensing is handled through the Volunteer Examiner program. Volunteer Examiner Coordinators (VEC) must publicize the "when and where" of their upcoming test sessions. They are allowed to charge a small fee for giving the test, but there is no fee for the license. Test sessions are often given at schools and other public buildings, but there is no standard rule on venues.

I would try the n9tax slim jim. $26.00 Dual band comes with 16' of quality coax and end connector of your choice. I ordered 2 along with a "HT saver" jumper with the sma connector on the end .response was great and the antenna works great and folds up into a small pouch.

5353. Battery level at power up

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-02 02:02:39 UTC
From: Adam
Topic: 5353 Message: 5353

I apologize if this has already been covered, but a search didn't turn up anything. (it's possible I wasn't wording my search properly)

Is there any way (if it's possible at all), when I power up my UV-5R, to have it show how much charge is left in the battery? My KG-UVD1P and UV-3R show it, but I can't seem to do it on the 5R.

Thanks in advance for any help you may be able to provide.

:-)

Ray, not really an answer to your question, but I also bought my 3600 mah battery via eBay. Cost was a "Buy It Now" price of $26.00 with free shipping from eBay seller "radioshop888".

It fits the radio tightly, no wiggle, no slop, very secure. Also, it improves my hand position on the radio, making it easier to operate. With the smaller 1800 mah battery my ring and little fingers hang off the radio. The balance with the larger battery is good, too. It just feels "right".

The styling of the battery matches the radio, too, and it looks like it was made together. It does not look like an awkward "add-on". Seeing the battery on the radio one would never suspect it to be any other way. Also, my UV-5R's case is red, and the battery's red color matches very well.

It came to me with a good charge, it seemed, but I dropped it into the UV-5R's charger and it was topped off in just a few minutes.

What I will do is use the larger 3600 mah battery as the primary battery and keep the smaller 1800 mah battery as spare power.

73,
Paul - AE5JU

I second the above statements. The battery is perfect.

In fact, I just won an auction for my second UV-5R "new model" with the larger battery. I plan on having one primarily as a dedicated handheld and the other as a mobile. Since I'm not a heavy mobile user, it should be okay. I'm concerned that I'm screwing up my antenna threads switching out one antenna for another. Good luck on the searching. When you get one you won't be disappointed.

I got mine here http://www.radioshop888.com/radioshop_product.php?id=104313 It came in about 10 days from China. This website is the same folks as the ebay id radioshop888 on ebay. They are a few days slower than other stuff I've gotten from ebay or from www.409shop.com, but it did get here sooner than they promised.

I am very pleased with how well the battery fits the radio. I thought it would have some wobble to it but the bottom of the radio fits snugly into the contours of the top of the battery. I'd give a report of how long the battery lasts, but it hasn't gone dead yet.

Been thinking. I'm a father in a sucky economy. Every penny counts. I'm an amateur radio operator because, like my profession of nursing, I have a need to help.

That being said, however you cut it this stuff is made in China. Might as well save myself a few bucks and wait a couple more days to get it closer to the source. Sure, the middleman loses out and I feel a bad, but I gotta look out for my family first.

Tygre,

If you manually program channels using the HT keypad, I'm not aware of a way to make them not scan.

If you program using the Baofeng software, you set the cell in the SCAN_ADD column to YES to include that channel as being scanned.

If you program using the CHIRP software, you remove the "S" (leaving the cell blank) from the Skip column.

I'm confused what's the difference between

steady VHF/UHF reception with display led off 70mA

FM listening, display led off 100mA

I would think that the current draw would be a function of the volume not the frequency?

73 Larry K1ZW

just made some simple amps measurements that I want to share, so one can figure power consumption

---

consumption:

with radio OFF 14uA

in standby 67mA

steady VHF/UHF reception with display led off 70mA

short VHF/UHF reception with display led on 100mA

FM listening, display led on 140mA

FM listening, display led off 100mA

transmission when Tx power on LOW 0.7A

transmission when Tx power on HIGH 1.4A

My guess is that it is because broadcast "FM listening" is handled by different chip than the "VHF/UHF" walkie talkie chip.

I know, but that's what I got... double checked and triple checked. Also the 14uA seems a bit odd since there is a mechanical click button...Forgot to mention that volume seems to have little influence on the current.

Any of you who have been hacking away at the UV-5R's data structure, or otherwise backwards engineering the radio or the Chinese software ...

Please join IRC channel #chirp on irc.freenode.net

That's irc://irc.freenode.net/chirp

I've spent the last two days really digging into the radio's data image, documenting various offsets and their purpose, and it has been a lot of grueling work. Mainly time consuming as each tiny change requires me to read the radio, save to file, and compare in a hex editor, wash-rinse-repeat.

There are a few areas I'm stuck on. Namely I'm having trouble figuring out how the radio stores VFO A/B frequencies while it flip-flops between the VHF and UHF bands. There's some really funky stuff going on that just eludes me, and I'd like a fresh set of eyes.

Please pop on by.

Grab yourself an IRC client if you don't already have one. I like mIRC myself.

irc.freenode.net (port 6667 or ssl 7000)

Even without the programming cable in hand, CHRIP can still pull frequencies for you from RadioReference, RepeaterBook and RFinder.

When you do get your cable (order it right away!), be sure to use the Chirp Daily Builds (ie alpha/beta versions) for UV-5R support.

Memory channels programmed via keypad are defaulted to Scan on. With the programming software you can select Scan Add Yes or No. Allchannels with Scan Add Yes should scan.

The difference is simple, FM b'cast is handled by an RDA microelectronics RDA5802 IC, When in FM b'cast, you are using another
component that uses 2 microamps in standby and 18 milliamps plus supporting component current when active.

The RDA1846 fm transceiver IC itself doesn't cover those frequency ranges.

Better yet here is the website for ALL NE repeaters. It is updated before Chirp or any others as far as I know and they keep up with problem units as well.....
http://www.nerepeaters.com/ almost always your "local" information will beat printed data such as you will find in Radio Reference or Repeater Book as this is generally updated nightly as events happen during the day.

Be sure to read the whiole entry as it may list a repeater but the condition (online/offline) is usually shown.

Enjoy

John

Been doing a lot of reading on here and really think I will be getting a great deal on a very nice radio. Bought the programming cable, software, earpiece mic and radio all together...I am sure that I will have more questions when I get the radio. Been "playing" with the software I downloaded a while back as well.

Is there anyone in the Louisville Kentucky area that already has one of these that would be willing to share their programming file for comparison to what I have or for copying into mine?

Thanks for all the great information about this radio.

Doug

On my Chirp the "S" is inserted when you want to skip a channel. At least that is what Chirp puts in the "Skip" column.

Tygre,

If you manually program channels using the HT keypad, I'm not aware of a way to make them not scan.

If you program using the Baofeng software, you set the cell in the SCAN_ADD column to YES to include that channel as being scanned.

If you program using the CHIRP software, you remove the "S" (leaving the cell blank) from the Skip column.

Yes, they do. Sometimes they have backlogs to deal with, which will delay things. Instead of one day, it sometimes takes three days or so before you will be notified.

Ken,

Having placed an order with them, I experienced the same lack of communications from 409Shop.

After 5 days, I emailed them, and 24 hours later, I received an answer, informing me my order was mailed out 4 days after my purchase.

I kind of figured 409shop is very busy.

I purchased a "Slim Jim": from http://www.n9tax.com/ . This is available in both a 2m only and a 2m/70cm version for around $26. It is by far one of the best, easiest antennas to work with. See other posts on the group site and watch some of the Youtubes on it.

Do not mount it in a pipe of any kind.

5388. New owner of UV-5R with 3600mAH battery

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-02 15:47:49 UTC
From: N7LN (Darvell)
Topic: 5079 Message: 5388

I just got my new black UV-5R today. I won with a $59-bid with free shipping. It has the 3600mAH battery, but no standard battery. Took 9 days to get here from Hong Kong to Utah. I wasn't home when the postman attempted delivery yesterday, so I had to pick it up at the post office this morning.

Wow, I'm impressed. I've had 3 UV-3R's for close to a year now. Well, more like 10 months or so. The UV-5R is such of an improvement, wow. I bought it for an emergency TO-GO box, but dang, I just might end up using it full time, as well as for Echolink access around the house with my Echolink base station, since this one has the touchpad. I haven't used it yet, as I'm at work, so I don't have much experience with it yet, tho. The battery was full enough to turn it on and briefly check it out, but now it's on my desk charging.

I also ordered the standard battery (mine came with just the 3600 one), programming cable, and battery eliminator, which are apparently coming in a separate package, because I didn't get them, and I noticed these 3 items have a different tracking number. I'm glad the radio came first--I'd go crazy with accessories for this radio without having the radio.

I can see I'm going to be pleased. I'm meeting with my emergency communications net group tonight in a face-to-face "antenna/emergency-power" party, so I'll take it along to show off.

I've been on this group since I ordered, about 10 days ago, and have been reading the comments so far. I hope to have something to add soon.

If you order via eBay, they are required to notify you when they receive the order and when they ship it.

For the 409 shop, shipped means the mailing label was printed. When the UV-5R first came out, many people were notified their radio was shipped, but the 409 shop did not receive them from the manufacturer for another two weeks.

I have, from hard experience learned not to buy from one of the eBay 409 shop vendors (it's a franchise) who gave me the run around on a small part. I also learned NEVER to give them feedback until after I test each item I receive from them completely.

If they get a negative feedback, eBay raises their listing fees, paypal reduces the money they get and if there are too many (around 5%) they are forcibly removed from eBay.

The lady that runs the website is not one of the eBay vendors and seems to be ok, no one has complained about her on any list I am on and she was reported as "fixing" problems caused by other franchisees.

You must always bear in mind that they are in Hong Kong, which is part of China, so they follow the Hong Kong and PRC holidays. The 409 shop does not post messages on eBay or their website about them, and there were a large number of complaints in February when all of the stores in Hong Kong, the post office and the courier services closed for two weeks.

There was a shorter, by 2 or 3 days, string of Holidays observed in mainland China (and everything there was closed too), and only about a week of them in Tiawan.

If you compensate for the difference in date and time, you could always call them, Skypeout for example is $.023 (2.3 cents) a minute, and most other VoIP rates are the same.

Geoff.

Nice score, you beat me by $7. The radio with the 3600 battery is nice.
I've been on this charge a week and a half now. The standard battery
lasted a good while, but for emergencies, this battery is definitely on my
to buy extras. Enjoy the radio it is awesome for the money spent.

Bought a yellow uv5r 2 months ago from 409shop. Took a full 10 days to arrive. Not bad. Manually programmed local repeater and one in myrtle beach when I was on vacation. Good hits from 10+ miles to my Louisville repeater, and while in Myrtle Beach I was over 15 miles away and made good contact with locals. Happy so far. It's much smaller than I thought it would be. So far , so good.

I have ordered two UV-5Rs from 409shop, on separate occasions. The first time I got an order confirmation email within 24 hours, but no shipping email. My radio still arrived in 15 calendar days, which is what I expected. I actually sent them an email query the morning of the day the radio arrived. The second time I got no order confirmation email, but I got a shipping email with a tracking number. That one came in 9 calendar days. The inconsistency of emails is a little concerning, but I trust them to send me my order in a relatively timely manner.

For those of you who have done business with the 409 Shop, do they normally send out an email confirmation of the order? I ordered an antenna from them, and aside from a PayPal receipt, I have not received any correspondence from them at all. Is this normal for them?

You can also make your own j-pole antenna at home. Google j-pole 2 meter and you will get lots of hits. Otherwise, ordering the Slim-Jim mentioned would be a great choice as well. It is an awesome antenna. You can order it with the correct connector for the 5R, or if you think you may get a larger radio later, like a mobile to use a base, you can order with the PL-239 and then get an adapter at radio shack to connect the antenna to your 5R.

I have the Slim-Jim. But I also made my own "copper cactus" j-pole in about an hour with a few parts from Radio Shack and 10' stick of copper pipe from the local hardware store. Both antennas function extremely well with the 5R, my FT-60, and also as a wide-band scanner antenna.

Hi To All.

Planning to order the UV-5R early next week.

Will be the first handheld I've owned, from an amateur point at least.
Live in Carlisle, UK, now retired and I spend most of the day messing about with the radio and computer.

Up here in the north west of England we have two repeaters covering Carlisle and south west Scotland, one VHF (GB3AS) and one UHF (GB3CA).
Sadly, both are under used, but maybe I could raise some interest!!!

About half dozen of us locals gather on 144.575 FM for a local natter!
Looking forward to both using and learning about this little gem . . . . . .

Regards to all

John ☐ G8CAU.

I have made purchases from 409Shop, radioshop888, and solidradio, and all were good experiences. Even with one defective UV-3R I purchased for a friend who does not do eBay, solidradio exchanged it with minimal hassle, only asking that I first try a reset to see if that fixed the problem before returning.

The difference is simple, FM b'cast is handled by an RDA microelectronics RDA5802 IC, When in FM b'cast, you are using another
component that uses 2 microamps in standby and 18 milliamps plus supporting component current when active.

The RDA1846 fm transceiver IC itself doesn't cover those frequency ranges.

unit finally got released from New York and arrived today. My goal was to get it up and operational for less than $50. Missed it by $1.95. The radio came from AliExpress and cost $42.95. I ordered a db9 serial programming cable from Ebay for another $9 so I didn't quite squeeze in under $50, but close. I was prepared for the "tight" issue with the remote speaker/mic plugs and resolved that in just a few minutes. Programming was easy with the cable. It is at BFB251. The only thing that still puzzles me about this thing is the note on the bottom of the charger that reads (and I quote):
"note:Prevent cooks meals or is injured, only battery assigns carry on the charge". I think this label REALLY lost something in the translation.

I'm not aware of any mail icon. Displays are often generic and used in more than one radio. Chances are that the display is designed to show more than the UV-5R supports, and you spotted it.

My son and I recently purchased UV-5R's and seem to be having the same issue while on vacation. They seemed to work ok with our local repeaters but finding one out of the two repeaters near our vacation spot is having a similar issue with the UV-5R's.
We can hit (key) the radio all day long but when your listening to the repeater output (on another rig) while talking on the HT the repeater is not transmitting. As soon as you let up on the mic the repeater keys for an instant and then the tail drops as you would expect. Having my son available helped also in that he verified that he can here me fine on the repeater input frequency.

It's almost like the PL is not strong enough or the correct frequency to open the repeater yet it seems to key it at the end of the transmition.

I'm working on connecting my mobile rig to my new car so I can test the same power and antenna with a different rig.

The 'mail' icon to the left of the 'lock' icon, the 'bell' and 'speaker' icons to the left of it, the '5T2T' above the 'DTMF' icon and the 'triangle' and 'star' icons under both the channel number displays all appear to be undocumented in the manual and most likely unimplemented in the UV-5R.

Make sure you HTs are far enough apart to avoid the Tx de-sensing the nearby Rx. If the repeater signal is weak, your Tx can overpower the nearby Rx and it will not hear the repeater.

Chuck,

They are a combination of Vertex and Motorola HT's and as far as I know they are all programmed with 205N DPL.

I recently purchased the Smiley 270 Dual Band with the SMA male option. (Only two options are available on the web order form: BNC or SMA male.)

When I received it, the SMA Male connector was defective. A Smiley rep responded on the weekend and arranged to replace it with a SMA female. Apparently they'll ship antennas with any of the options listed at: http://www.smileyantenna.com/pages/base-selection-chart. You can order extra bases to use an antenna on multiple radios.

I don't see a way to order the desired base on their web pages. I'd try a phone order.

I like the telescoping feature. When hiking with the UV-5R, I'll probably carry both the standard antenna and the Smiley. One thing I'm experiencing is that the antenna doesn't receive very well when it's vertical--it works a lot better when held horizontally. Signal polarity?

BTW: I live on a hill and with the UV-5R stock antenna I'm reaching 70cm mountain top repeaters at 47 miles (full quieting) and at 42 miles (signal quality varies). This is with tall trees all around.

Does the receiving radio have Rx (Decode) tone turned on? DCS tones automatically send an end of transmission code (a sine wave) intended to turn off receivers, but it can only work with a receiver that is using DCS tones.

I am using CHIRP daily-20120730 build and NONE of my offsets will save. It lets me program them into the chart and save them, but they do not download into the radio and if I close and re-open the file, the offsets are gone from the chart as well.

I use the Baofeng software with the 3R and it works fine with zero issues.

What am I doing wrong?

5441. Nagoya NA-771 Antenna

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-03 19:56:29 UTC
From: toledohamradio
Topic: 5399 Message: 5441

Hi,
Purchased the Nagoya NA-771 antenna; about 15 inches from base to tip; however, I don't notice any perceptible improvement in VHF or UHF reception using the NA-771 instead of the factory stock antenna. Only on the FM music band do I notice a big improvement on reception with the NA-771.

As far as hitting the repeaters, the 4 or 5Watts just isn't enough power here to cut it for some reason. Hits the two repeaters 3 miles away decently, but mostly noise into the repeaters 8-10 miles away, VHF and UHF equally difficult, using either the stock or NA-771 antennae.

Can anybody suggest a 'portable' antenna better than the NA-771, or short of me connecting a 5/8 wave to the 'portable' UV-5R, thereby rendering it not portable anymore?

73
John

I'm running a similar antenna (NA-636) and experiencing the same characteristics that you are.
IMHO, you are experiencing typical handheld coverage.
A 5/8 antenna will make a little improvement, but not night and day.
Four watts into a 15" piece of wire does have it's limitations.

This time of year you will also experience what is called Green Leaf Attenuation.
Those little green buggers are like RF sponges.

Define "portable". You now have a 15" whip that still does not do what you want or expect. I can hit repeaters within 3-5 miles fairly easily with the 5R with that $4 antenna posted on here many times. On a good day I can hit repeaters up to eight miles. But ya, it is going to be hissy and scratchy. It is a 4 watt HT with a ducky. I can put my Yeasu FT-60 right next to the 5R and get pretty much the same results with this (http://www.diamondantenna.net/srh77ca.html). There is only so much you can do before you need to go more power, and or bigger antenna. Not all ducky's are made the same, but a ducky is a ducky.

If I need to reach out I hook up a j-pole or slim-jim. But then yes, I am now tethered to the antenna.

Depending upon how quickly the Volunteer Examiner Coordinator group reports the results to the Federal Communications Commission, you may be able to find your call sign online in three or four days.

Good luck to you!

if it is your first time expect about 6 to 8 weeks for your call after you pass. Just check the FCC database for your name and call to apear and then you will be legal to operate.

I took my test July 15, my callsign was on the FCC website the 25th. My paper license arrived this past monday. Most seem to take 1-2 weeks from the test date from what I read.

It really depends on when the examiners submit your application, and whether they do it online or by mail.

I took my test on a Saturday, my call was in the database by the next Thursday (and there was a holiday in between).

The vanity call sign took about 3 weeks...

5457. Nagoya UT-108

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-04 04:16:43 UTC
From: cskrmetti
Topic: 5457 Message: 5457

Just wanted to share some information on the Nagoya UT-108 that I purchased from ebay. First I would say that based on my experience thus far, do not buy. I hooked it up to my uv-5r and the reception is very poor. Very VERY poor. In fact, when I was sitting in the car with the antenna mounted on the roof, I could get better reception by attaching my Nagoya 701 or 771. Even with the interference from inside the vehicle, the "ducks" were better than the UT-108. So far I've found the 771 to work very well on VHF and the 701 seems to work as well or possibly just a hair less than the 771. I can't really tell on UHF yet, because we haven't used it to make any contacts there. I could hit a repeater from over 25 miles away with the 771. Where we were standing was just a couple of feet above sea level but we were talking to a repeater where the antenna is about 300' above sea level. I'm going to continue to tinker with the UT-108 but right now it seems to perform poorly. I can say that I was easily able to hear the local repeater's net call tonight while mobile, but that's something I can normally pick up well with the other antennas.

Mine failed after a few months. What I found was the coax connections are poorly made but repairable and the antenna now works as expected.
To repair you have to remove the magnet which requires quite some force as it's very strong.
Persevere with it and you should finish up with a very usable antenna.

I too had some bad experience with this antenna. Range was barely usable. The 771 is still the best for the UV-5 in my humble opinion.

Make sure the cable is really into the radio. Mine looks like it has gone in but if you squeeze the radio firmly with one finger pressing the plug it goes in a bit more with a sharp click. If I don't remember that then I can't read the radio either.

Funny, John, I just received an NA-771 from 409shop this morning and noticed the same thing. I put it on the antenna analyzer and the SWR at 145 MHz is about 8 to 1. When I do a sweep there is a broad curve with the dip around 3:1 at 200MHz. It performs no better than the much shorter NA-701 which I have had for a couple of years.

When I look at the base of this antenna instead of a black label with silver writing like my NA-701 the words Nagoya NA-771 etc are printed directly on to the antenna in blue. I have seen exactly the same color lettering on a fake Diamond RH-771 antenna which also performed poorly.

I don't know whether Nagoya has changed to using this printed blue lettering or whther there are now fake Nagoya antennas as well as fake Diamond antennas to look out for. I purchased from 409shop as I beleved them to be trustworthy and reliable.

I hate purchasing from UK dealers because they are all rip-off merchants but I am going to give up buying antennas on eBay unless I see a forum post from someone who has purchased a specific antenna and checked it out.

Hello,

As others have stated make sure you have the right drivers and you have the cable securely in the Baofeng. If you are using the Baofeng software I may suggest you try CHIRP - for me the Baofeng always fails to read 100% but CHIRP has zero issues.

If you have trouble reading the baofeng uv5 software 100%, reduce the baud-rate to 2400. I works 100% for me at 2400.

Once I learned to seat the cable well in to the socket, downloaded a driver that would work with it and set my Com port correctly I have had 100% read/write using the Baofeng and Chirp Softwares since April. Disregard any of the three and perhaps the baud rate and you will have issues.

To those looking for a good antenna I think that the $3.79 unit works super. I do not have any fancy test equipment, I just go by if I can hit a repeater 35 miles away or not when comparing the original/Flex Slim Jim/$3.79 Job.

It's actually a $3.79 antenna. Search the group with "$3.79" and on the 2nd page of results you sill see posts with eBay sellers.
Jim KC9HI

p.s. That is the antenna I am currently using.

I'm a VE with the LARC VEC here in Baltimore, MD. And we have test sessions the first weekend of every month. We load the info to FCC on Monday. And the New Calls are listed that very same day. So you pass your test on Saturday. You can be on the air on Monday night.

BINGO!!! And we have a winner!

I am a W5YI CVE. If I give a test prior to our club meeting on a Wednesday evening, I then double check the paperwork Thursday morning, making sure all the i's are crossed, all the t's dotted. I email scans of the test session paperwork, including the test answer sheets, to W5YI and they immediately process it for new Techs.

We want to do everything we can to get a new ham on the air as quickly as possible. I snail mail the paperwork that day, and a new Tech is usually listed in the FCC's ULS by Friday evening, or at most, the next Monday.

Of course, a ham that is advancing to General or Extra may already operate with his new band privileges right away, so there is no need to rush things.

Time it takes to get listed and legal to operate depends on how fast the CVE gets the paperwork to the VEC (the folunteer examiner organization).

Might I make a serious suggestion? Continue to go over the Tech material, but also look at the General. I will tell you this... if you are smart enough to pass the Tech, you are smart enough to pass the General. And with the General comes greatly expanded band privileges. It is the "most bang for the buck" license.

If you take and pass the Tech you will be offered the opportunity to take the next higher test, General, at no additional cost. Ditto, if you pass the General, you will be offered the opportunity to take the Extra.

I've given people that passed the Tech the General test and had some say, "But I didn't study for that!" They took it and missed passing by just a few questions. My question to them, "If you had at least looked over the General material do you think you could have picked up a few more correct? If you had done that, you'd be a General now."

And almost every one that did as I had suggested earlier, began studying the General, also passed that. I've had others pass the Tech, come back a month later and pass General.

DO NOT shortchange yourself. There are free study guides and test pools to be found online. You can find the Tech, General, and Extra test pools online at ARRL. If not, email me at my call at ARRL dot net. I'll send those to you. You can also take practice tests at QRZ dot com, eham dot net, and others. Do these. Do 2 or 3 an evening. If you are passing Tech 90% or better, you need to study General.

Strike while the iron is hot!

5487. UV-5R for blind hams

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-04 16:40:49 UTC
From: tenorman1952
Topic: 5487 Message: 5487

I have a blind ham friend that I immediately thought of about the UV-5R. I emailed and offered to send one of my two UV-5Rs to him to play with. He emailed back, no need, that he had just gotten one a short while back.

I asked further how the voice synthesis was working for him and he replied:

"It is great if you can remember what frequency is on what channel. It only gives the channel number if you are in memory and if you are in VFO it gives the frequency. The programing software is not speech friendly so you need a sighted person to program it for you."

So, is it possible to make this radio read out the channel labels?

As far as his programming software comment, he uses Word, Excell, and other programs with a "screen reader" program. He has no difficulty running his net (he's a net manager and one of the net controls). He uses headphones with a mic boom, foot pedal PTT, his radio has a speech synthesis module, and an LDG talking watt meter. Listening to him on the air running the net you'd never know he was blind. I didn't for several years.

So, what else can be done on the UV-5R for this?

73,
Paul - AE5JU

I purchased mine 3 weeks ago, it does have the sticker declaring Part 90 compliance. It is Version BFB251 (hold 3 while powering on). The FCC ID on the sticker is ZP5BF-5R (google that, it will bring you to the FCC web site and the compliance exhibits).

Does your new UV-5R have a different FCC ID?

Topic: 5487 Message: 5490

For programming with the computer, the short answer is, "Forget about it". The longer answer is, "Really. Forget about it. No joke."

The good news is that the UV-5R is very usable from the keypad for blind hams. Send your friend this file:
http://buddy.brannan.name/baofeng-uv5r-eyes-free.zip

No one has come out with a HT that will read out frequencies, unfortunately. The best available are any of the Chinese HT's, Baofeng UV-5R, Wouxun KG-UV-whatever, and I understand, the TYT TH-UVF9. None of these, however, will read alpha tags. Nor will they read out operating frequency. But they definitely read more than anything else out there.

OK OK, so much for the SMALL radio. I ordered one of the new LARGE batteries after my original battery fell and broke the clip off. The new one arrived today and looks good. I have to change my mind. It does feel better in my BIG hands. BTW, I used Gorrila Super glue on the clip and it lasted about four days until I knocked it off my table again. Reglued it and am trying to be more careful.

I have to change my mind. It does feel better in my BIG hands. BTW, I used Gorrila Super glue on the clip and it lasted about four days until I knocked it off my table again. Reglued it and am trying to be more careful.

what i like about the radio was its size, small enough to go nicely on the belt clip but not that big to make it uncomfortable. ive never complained about the battery, lasts long enough for my use. i would think the added weight would be an issue for me. dosent fatigue my hand if i grip for periods of time like my ft-250r does. you would think they would start using lipo's. very light, i am an avid rc heli pilot, and ive seen them used in smaller cordless appliances. expensive yes, but can be worth it for the weight trade off.

"Daily Digest" means, "Daily or when there's 15 messages, whichever comes first." So you'll get several a day from an active group.

Alternatively, you can search eBay for "Universal Kenwood" which seems to pick up the (several similar) ads for this baby.
At the risk of sounding like spam, this antenna is a medium sized, well made, handsome, and flexible duck, and a great performer on VHF and UHF at any price.
At the $3.79 level it is an insane value, and everyone with a UV-5R should get one. eBay item 271010902869 is "on sale" for 20 cents cheaper for a day. Like,... do it already.
 Perfect compliment to your ultra-value $50 radio.
No, I don't get kickbacks. :)Ian--- On Sat, 8/4/12, Jim <jru.uv5r@...> wrote:

It's actually a $3.79 antenna. Search the group with "$3.79" and on the 2nd page of results you sill see posts with eBay sellers.

Jim KC9HI

p.s. That is the antenna I am currently using.

From: aggieoutlaw
Topic: 5399 Message: 5497

Same here. NA-771 from eBay. Same blue lettering. Quite bad reception.

I was on a SAR mission last night and everyone's radios (nice ICOMs) had stock rubber ducks and had much better reception than mine.

It shouldn't bother me that a $350 radio gets better reception with a stock antenna but it does. It's pretty embarrassing to have a large VHF quarter wave with no reception while a stubby rubber duck has full signal quality right next to me.

I eventually turned my radio off because the quality was so bad. I'm pretty sure the stock Baofeng is better. Although, it gets hot when I transmit VHF full power.

I don't want to spread rumors, but I have read posts and eHam reviews suggesting that NA-775 "Nagoya"s with blue stenciled lettering are dismally performing counterfeits. To make matters more complicated, Nagoya has started using 775 and S775 ("short') for two genuine models, which have the traditional Nagoya mirror-on-black stickers.
It sounds like the cloners have expanded or rebranded to use the popular 771 moniker. I suggest complaining to your eBay vendor. It sounds like the reputable dealers are getting taken in by this fraudulent inventory, and are unaware.
I'm sure if properly motivated they would choose to protect their reputation.Ian--- On Sat, 8/4/12, aggieoutlaw <brad.s.jones@...> wrote:

Just purchased 2 UV5R's at the hamfest and can't seem to get the programming software to work.

I've downloaded the .rar file from the groups, and also the zip file from http://www.wouxun.us/category.php?category_id=60 no matter which one I try to use it won't connect to the radio for read or write, and I'm unable to save any files from the software.

any idea's on this one folks?

Thanks,
Adam

5514. Public Safety Frequencies - More Sensitivity

Yahoo group: baofeng_uv5r (2012-07 — 2012-09)
Date: 2012-08-04 23:08:58 UTC
From: aggieoutlaw
Topic: 5514 Message: 5514

I was on a SAR mission last night, my first with the UV-5R. Comm is always a problem on missions but my UV-5R was totally useless in the public safety band. I was very disappointed. I need to know what (if anything) I can do to improve my Rx sensitivity in the 155MHz band.

Here's the details:
I was using a UV-5R with a NA-771 15" V/UHF antenna. We use high band VHF public safety frequencies, narrow FM. The UV-5R programs fine and tests fine. During real-world (canyons, dense foliage, cliff bands, etc) use however, it does not do well.

The rest of my team uses nice ICOM radios and had perfect signal quality 95% of the mission (comm is always a problem). Yet, my radio rarely hit the squelch level and was not intelligible when it did. Based on other reviews of my NA-771 antenna, the quality is questionable lately.

Is the sensitivity of the UV-5R that bad relative to the ICOMs? Would a different HT be better (e.g. Wouxon KG-UV6D or KG-UV2D)? Is there another antenna I should try?

Thanks all,
-Brad

In an RF rich environment, the UV-5R is useless and it just gets worse with a longer antenna. I live in the shadow of a tower with 2 FM stations and a WX transmitter 1/2 mile away. I use 440 just so I have ears. Many radios are deaf here.

Well Brad,

There has been some discussion here about phoney Naygoa antennas, you may have one and that should be checked out. The $3.79 antenna seems to be a winner for many.

Also depending on how bad the antenna is off you must remember that 155mhz & 146mhz is about 10% difference to start with. Your Icom people may have had an antenna tuned for the expected operating frequency whereas you are working out of your range and then some.... maybe.

Would it be possible to try one of the Icom antennas to see if that is the case? That would be a great place to start.

I would be field testing more before I depend on it for this kind of work.

John

My 5Rs seem to have extremely good Rx sensitivity with the factory antenna. My mag mount really improves Tx but the 5R Rx is about the same with the mag mount or hand held out the window. If I remember correctly, I measured squelch break at about 0.2uv on the 5Rs. This was at 145.5MHz. The 5Rs always seem to be very good on Rx. This is in a reasonably quiet RF environment around the mountains of Northern NM.

If you're talking about D-Star transmissions, then I believe the answer is no.

Other digital modes, which are modulated onto a standard voice channel (like AFSK modulation used for APRS) can be decoded (and encoded) by connecting the radio to a computer. There's even an app for that(™): http://koomasi.com/pocketpacket/

I personally haven't tried this yet, but I intend to.

I also purchased the 3.79$US antenna. Fits the UV5R perfectly, w/o any gaps, just like the original. No problems with hitting the local repeaters while working in the basement.

It is just a couple of inches longer than the original and is much more flexible; came in an envelope almost bent over on itself.

Links to reviews in the message base.

I think it does through the audio jack. This is from the app " For best results though, connect your device's microphone-in port to your transceiver's audio or data-out port and vice versa. The iPhone's microphone-in and audio-out ports are available at the 4 conductor 3.5mm connector located at the top of the device."

I'd probably get something like an "easy digi" interface to put between the two devices for some isolation.

It's funny that both the RF environment and NM is mentioned. I live in Albuquerque NM and the mission was below the Sandia Crest which is home to dozens of very high power RF transmitters. That could be the problem, of course the ICOMs still worked.

I just bought one of the 3.79 antennas today. I'll try that but for now, I'm gonna stick with the stock antenna which has noticeably better reception in my house.

Thanks for the responses, all!

> How does one set the baud rate?

You can't.

For Windows, in the control panel properties for the serial port there is a baud rate and parity setting.

MacOS and Linux would use the stty command.

You are welcome to ignore them or set them, but the software overrides them.

If you look at the CHIRP source code, it sets the baud rate to 9600, which I assume is the correct rate and the BAOFENG software uses it too.

Geoff.

I also picked up - by luck - a NA-771 with the foil and black-ink
label. The antenna seems to work better than the factory supplied unit.

I prolly paid more than I should have, but this unit seems to be pretty
good. Here's the vendor

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=261076538388

I'm using Chirp with the wacky USB cable on OSX - it did take some
kinda driver to run right, but I got it working, and I'm having fun
listing out the interesting repeaters and other things to listen to.

Just seen these messages.

I have two of the 5cm stubbies.

My second one turned up yesterday (I wanted a normal SMA and a
reverse SMA to cater for all my rigs).

They work very well considering their size,and just as well as the
genuine Diamond stubby.

So far they are the only cheap stubbies that work.

All the others are crap.

Top man for letting us know!

My UV-5R arrived yesterday and I'm still struggling with the manual programming of the memories. I think this might take a few days to resolve....

It's nice to be able to order something that's tried and tested.

Thanks again.

Michael

Thanks for this info but I am still stumped after a few hours of trying. My disk will not run and load and I see nothing come up on my computer like the examples show. It basically loads a slide show of pictures. My computer recognizes new hardware VIA usb but when I plug the radio in I get nothing. Manually loading in the freqs I need they don't stay saved. I hear nothing. Honestly, I am totally lost here. I bought this little radio to keep in the car and plan to upgrade to a portable car antenna. Need to keep track of the area emergency services because of the grass fire dangers we now have that can move quickly. I have no working knowledge period of this stuff.

Unless I'm mistaken, you want to listen on channel A and scan channel B. This is possible on my UV-5R. Turn Menu 7 option (TDR) on. Then hold down scan on channel B for a second or two.

My apologies to the group because I know this has been covered ad nauseum but I am still having issues. The interface works fine on my laptop running XP. I have been trying to get it to run on my Win7 machine with no luck. I have down loaded the drivers as recommended, restarted my machine, and attempted to update the driver by picking the newly installed driver. Here is my problem...where is it? I have searched my computer, looked in the drivers folders and have not been able to find any driver named Winvista7prolific.etc driver. How or where do I go to specify that driver? Thanks!!!!

Disregard. After testing this feature, John is correct. It does not actually monitor Channel A. The scanning channel stopped on my Channel A frequency but it did not interrupt the scan.

So, no I don't think it's possible.

Perhaps the rate is hardware dependent. Mine is set for 9600, works 100% on both Baofeng and Chirp. Does not matter as long as it works.

I saw that an audio issue had been covered during my search, but let's see if this one was, or if anyone has a clue. I am able to get audio from the unit. That is, the beeps, voice, and even monitor an incoming signal. However, on an incoming signal, I get nothing. I've set the squelch to 0 (from 9 to 0...not hitting every setting, but at least half), the CTCSS TX and REC are both set according to the repeater settings, I'll get a green light indicating receive when the repeater is activated (and can hear it when I press the monitor button)...but no audio as it's supposed to work. It did work at first, but as I programmed in new frequencies, they didn't work. Then out of curiosity, I deleted the channel that did work and reprogrammed it. Then it didn't work. The DCS is turned off (the repeaters I'm programming don't seem to use it)...perhaps I have something set incorrectly in the menu, but I have no idea what it could be. This started happening after I did a reset. Maybe someone can point me to a list the the menu items and how they ideally should be set or perhaps a setting that you may be familiar with that would cause this. Thanks all...Gil - WE5ABQ

Jim,

I am using Win7. The driver's name is Prolific version 3.2.0.0 and the date on it should be 7/31/2007. When you download something like this write down where it is going to reside or put it into a folder on your Desktop that you name "Download". That way you will always know where to find it.

It is a known fact that USB to Serial adaptors/cables that use the Prolific chipset/drivers have many problems
When trying to use them with Windows 7 or Vista although they work fine with Windows XP.
To cure the problem forever, get an adaptor/cable that uses FTDI chipset/drivers and is Windows 7 compatible
They have some at the following link: http://tinyurl.com/d3yluev
I use this one: http://www.usbgear.com/USBG-4FTDI-B.html
If you just want one port then use this one:
http://www.usbgear.com/USBG-232MM.html

Gil,

If you can hear the repeater with the monitor button pressed I would think that you might want to turn off the CTCSS on the RX side, could be that it is not in use or is incorrect.

That is, the beeps, voice, and even monitor an incoming signal. However, on an incoming signal, I get nothing. I've set the squelch to 0 (from 9 to 0...not hitting every setting, but at least half), the CTCSS TX and REC are both set according to the repeater settings, I'll get a green light indicating receive when the repeater is activated (and can hear it when I press the monitor button)...but no audio as it's supposed to work. It did work at first, but as I programmed in new frequencies, they didn't work. Then out of curiosity, I deleted the channel that did work and reprogrammed it. Then it didn't work. The DCS is turned off (the repeaters I'm programming don't seem to use it)...perhaps I have something set incorrectly in the menu, but I have no idea what it could be. This
started happening after I did a reset. Maybe someone can point me to a list the the menu items and how they ideally should be set or perhaps a setting that you may be familiar with that would cause this. Thanks all...Gil - WE5ABQ

What do you have menu #5 set to?
It should be set to WIDE.

Radio desense? It's trying to see a someone holding a candle while they're shining a spotlight in your face. Put some distance between the 2 radios and and try again.

And way to go, guys! It's working! It was a confusing issue since I had two of the 5 repeaters working with the CTCSS receiving tone set...but the other 3 weren't. I just turned it off for the ones that didn't work and I'm getting them all now. Thanks!!!

Gil

If you only need a few channels programmed, manually may be better. Here is a cut & paste of a manual programming procedure.

To program repeater 146.985, minus 600 Hz offset, 100 Hz CTCSS tone, low power level, wide band transmit,
into Channel #010

Turn on radio. Radio will announce Frequency Mode or Channel Mode. If required, press VFO/MR to enter Frequency Mode. If required, Press A/B to select upper display and Press BAND to choose the VHF range instead of UHF range.
Delete Ch 010 using Menu28 (Channel must be empty to re-program)
Press Menu +2+8 Menu Del Menu
Turn off dual-watch. MENU + 7 + MENU. Use the Â☐ Â☐ key to select OFF. Press MENU + EXIT
Press [MENU] + 1 + [MENU] Use the Â☐ Â☐ key to select 5 KHz Step
Press [MENU] + [EXIT] To accept and exit
Enter 146.985 The receive frequency
Press [MENU] + 25 + [MENU] Use the Â☐ Â☐ key to select Minus Offset (-)
Press [MENU] + [EXIT] To accept and exit
Press [MENU] + 26 + [MENU] Use the Â☐ Â☐ key to select 00.600 Hz Offset
Or use Keypad and enter 00.600 Hz Offset
Press [MENU] + [EXIT] To accept and exit
Press [MENU] + 1 + 3 + [MENU] Use the Â☐ Â☐ key to select 100.0 Hz Tone
Or use Keypad and enter 100.0
Press [MENU] + [EXIT] To accept and exit
Press [MENU] + 2 + [MENU] Use the Â☐ Â☐ key to select Low Power
Press [MENU] + [EXIT] To accept and exit
Press [MENU] + 5 + [MENU] Use the Â☐ Â☐ key to select W ide Bandwidth
Press [MENU] + [EXIT] To accept and exit
Radio should now operate the repeater if in range
Press [MENU] + 2 + 7 + [MENU] Enter 010 or Use the Â☐ Â☐ key to select 010
Press [MENU] + [EXIT] This stores the Receive Frequency
Press [*SCAN] (quick press) Display will show Transmit Frequency
Press [MENU] + 2 + 7 + [MENU] Enter 010 (if required)
Press [MENU] + [EXIT] This stores the Transmit Frequency
This method devised by Buddy Brannan (KB5ELV), author of The Eyes-Free Manual
